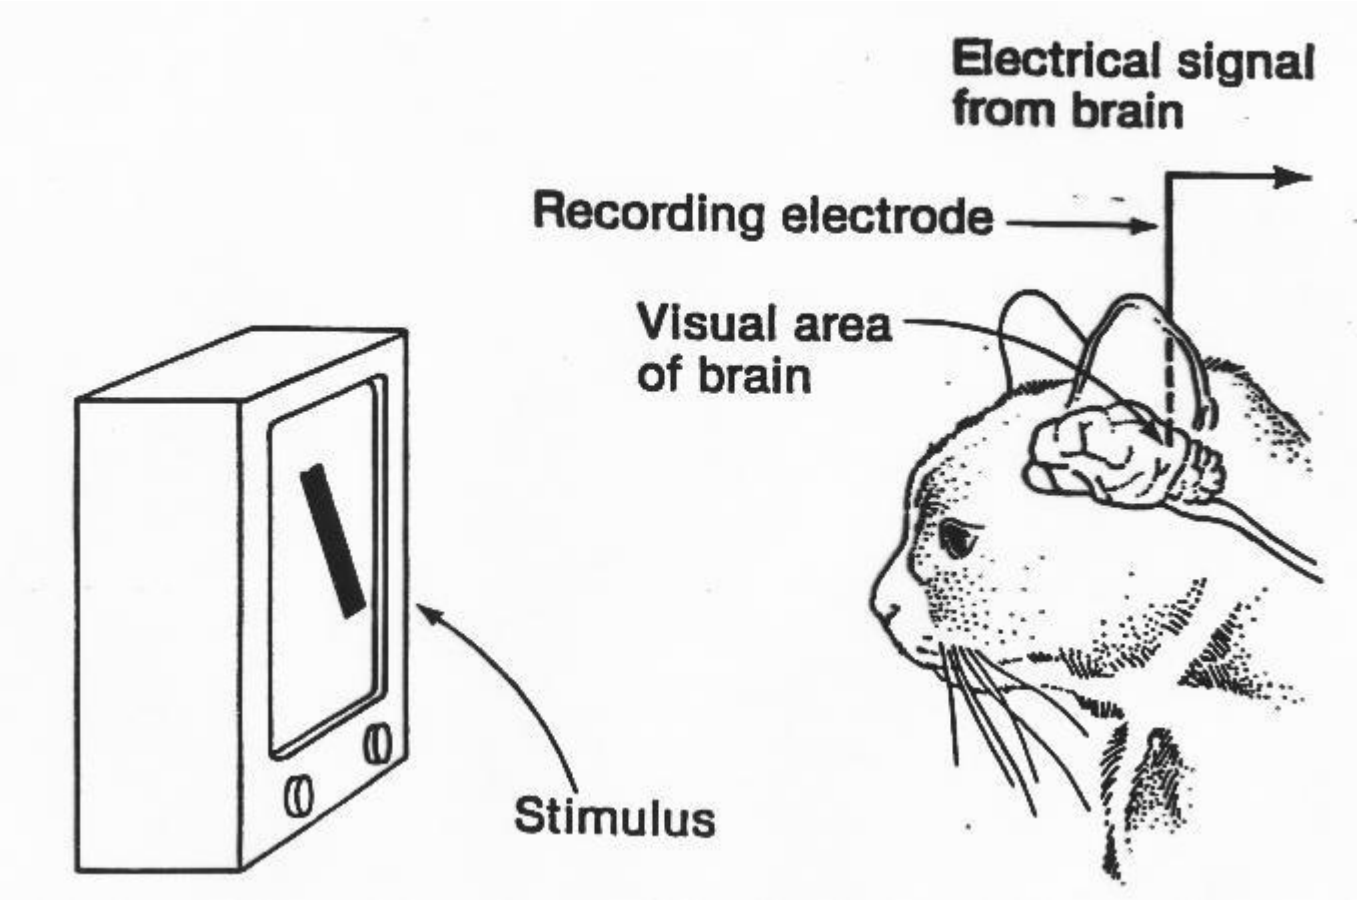
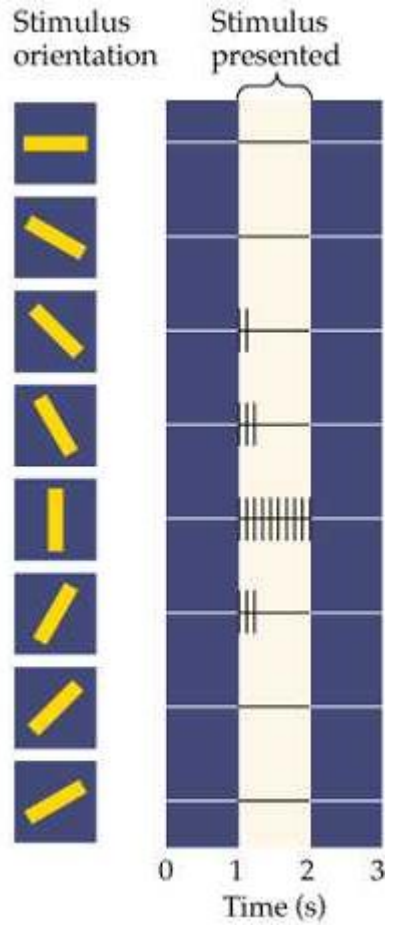
http://scs.ryerson.ca/~aharley/vis/fc/

Hubel & Wiesel (1959 ~)





Neurons in the visual cortex respond selectively to oriented edges. Neurons in visual cortex typically respond vigorously to a bar of light oriented at a particular angle and weakly or not at all to other orientations.

Hubel & Wiesel (1959 ~)

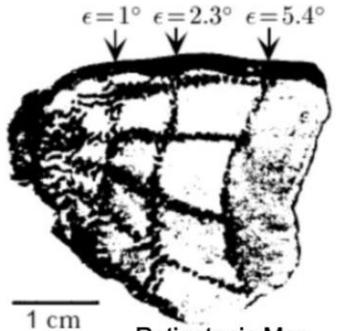
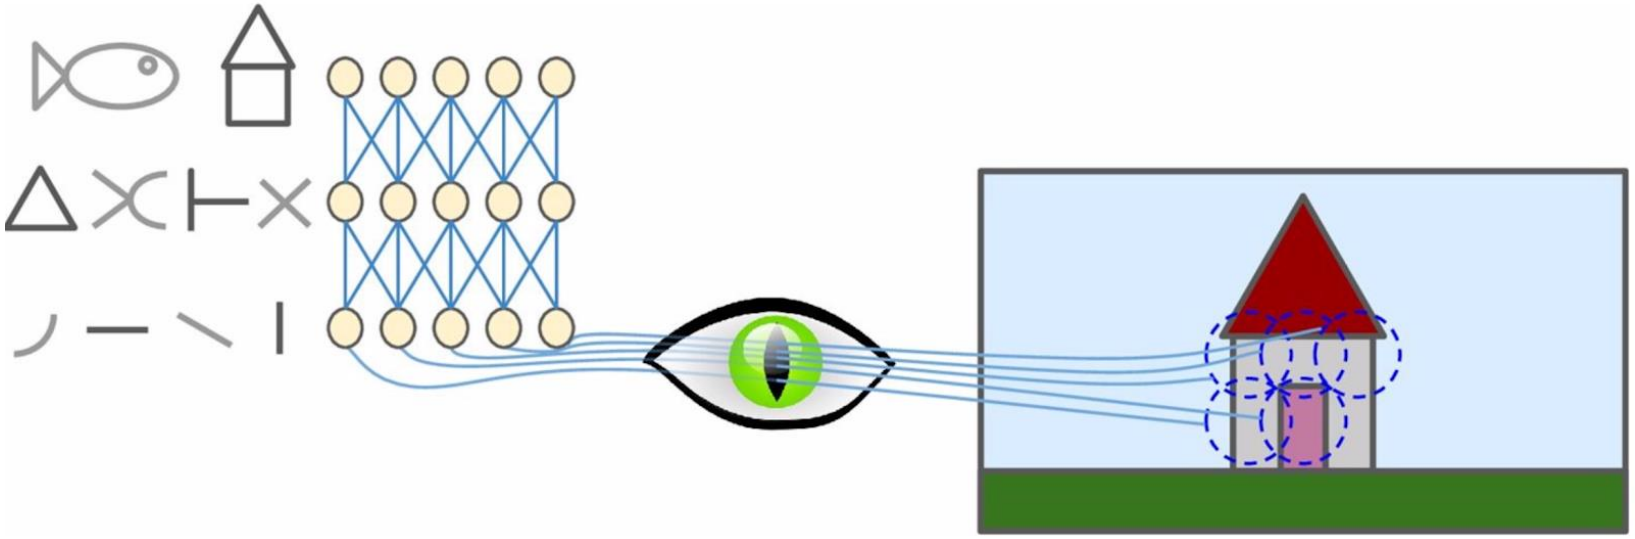
Topographic Maps in Cortex

(Dayan and Abbott 2001)



Retinotopic Map

- Each visual sensitive cell only responses to stimuli of a limited region (receptive field)
- Neighboring cells have partially overlapping receptive fields
- Neighboring points in a visual image evoke activity in neighboring regions of visual cortex
- In this manner, the visual system easily maintain the information of the spatial location of stimulus



The human visual system

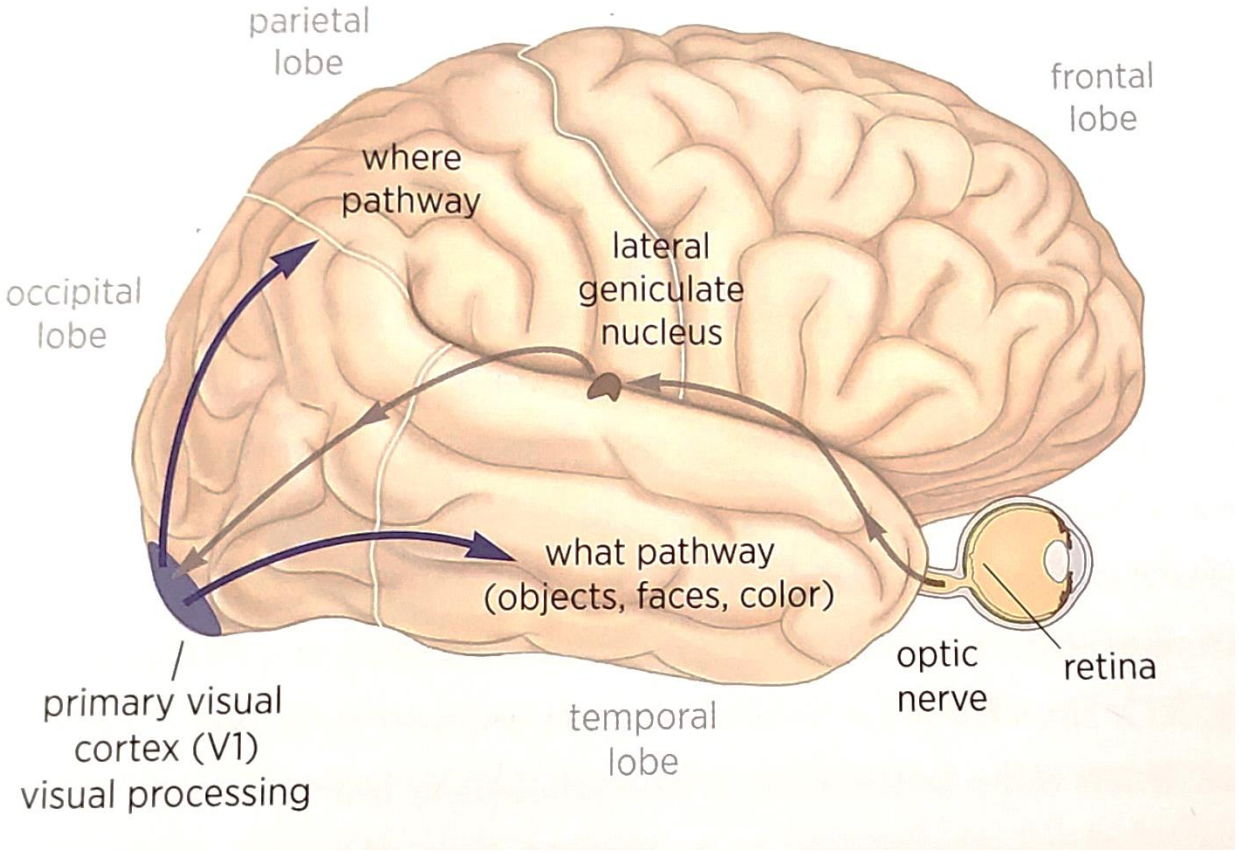


Image Courtesy: Kandel, "Reductionism in Art and Brain Science," 2016

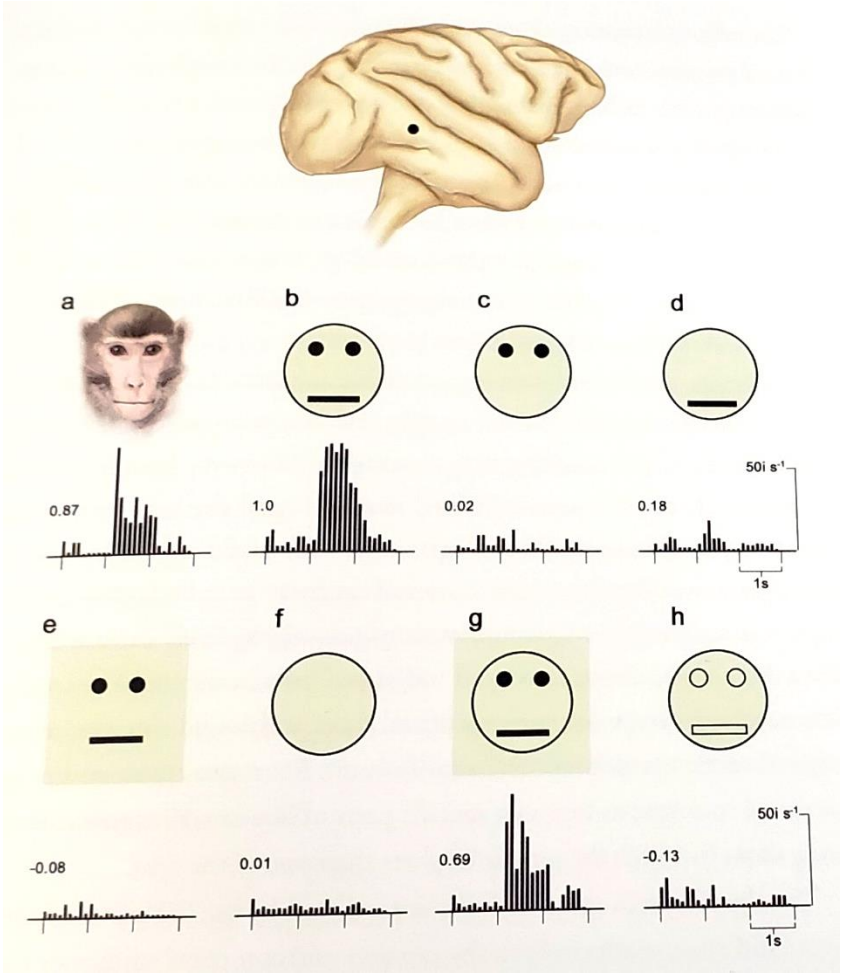
- Retina: visual input
- Retina → Lateral Geniculate Nucleus
  - Visual information flows through the optic nerve
- Lateral Geniculate Nucleus (LGN):
  - A small, ovoid object at the end of the optic tract
  - One on each side of the brain
  - In humans, each LGN has six layers of neurons
  - Sends information to the primary visual cortex (V1)

e.g. Facial Recognition



- Holistic face detection
  - "Face cell" in the inferior temporal cortex
  - Fires when there is a face-like object

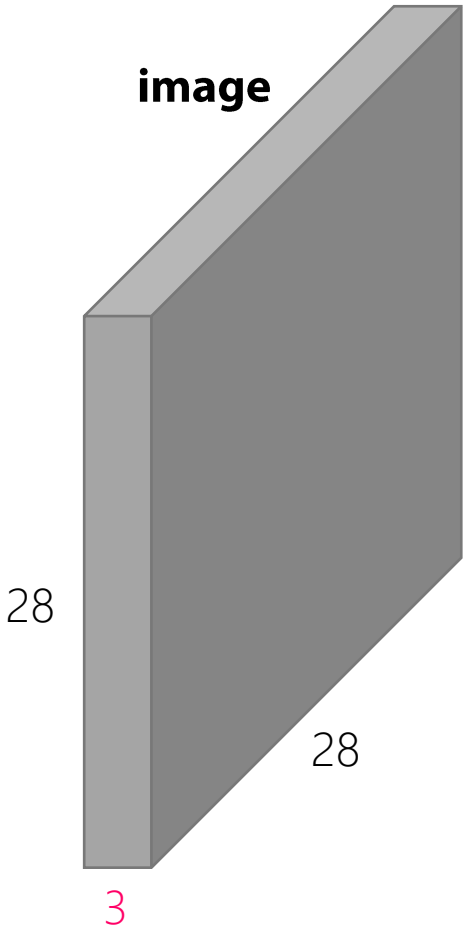
Image Courtesy: Kandel, "Reductionism in Art and Brain Science," 2016

Convolutional Neural Networks

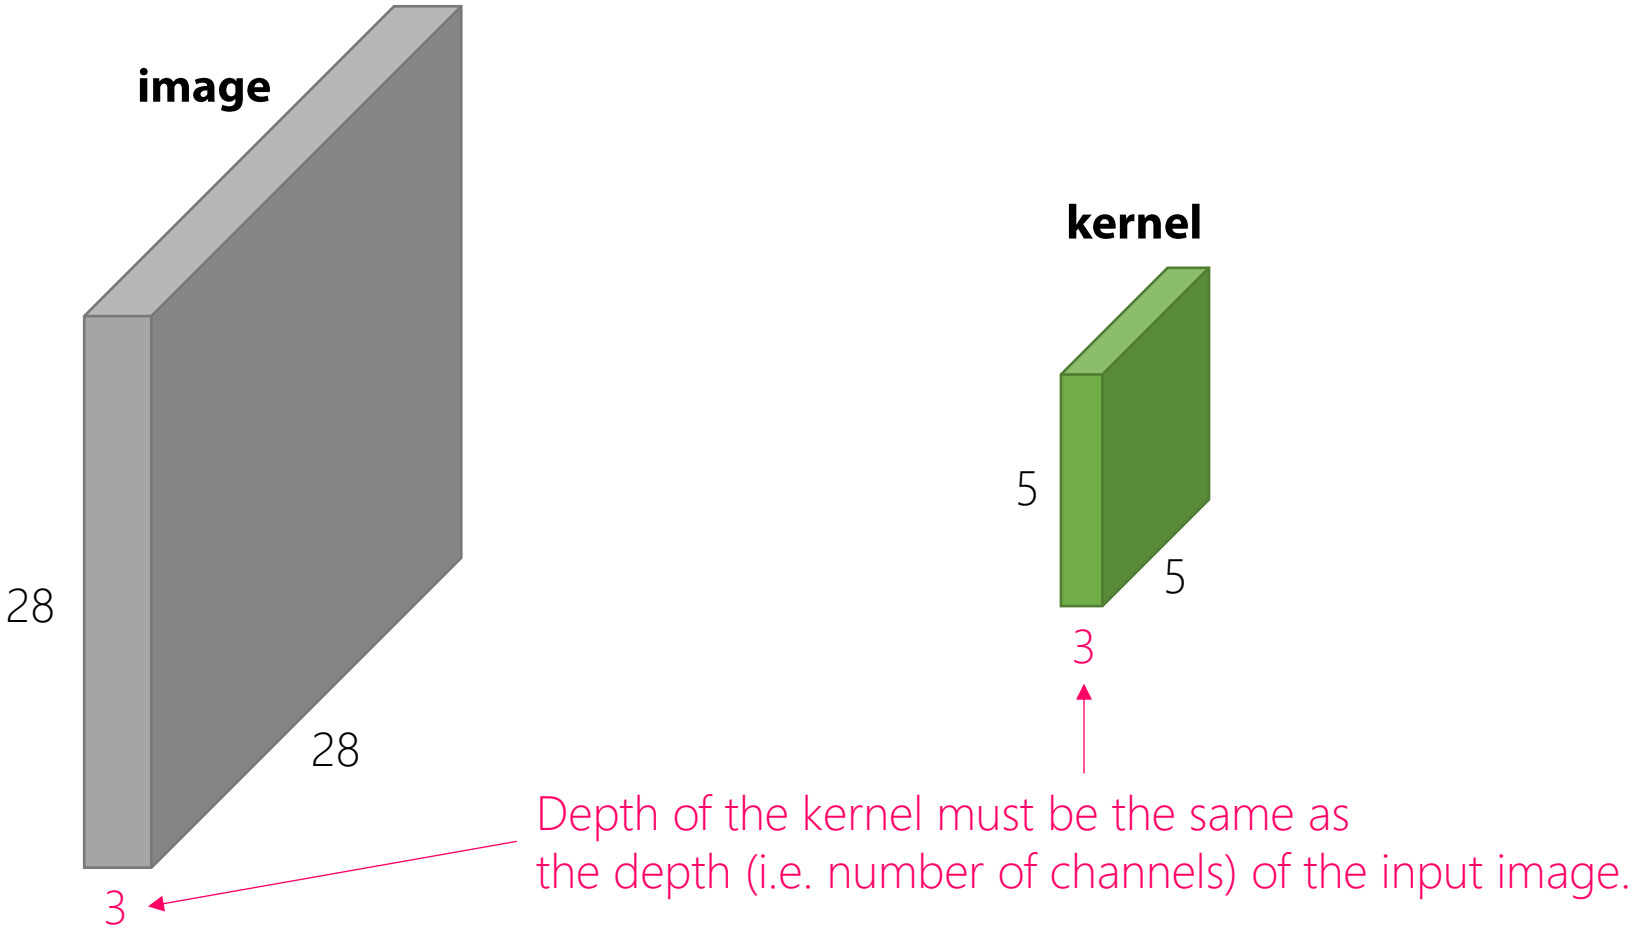
- Key idea:
  - As like how we (humans) understand a visual scene, if neural nets could see small pieces, understand patterns and textures, combine the pieces to see a bigger picture, computers should be able to recognize images.

- A bonus:
  - Typical neural networks are “fully connected”.
  - In an image domain, this means all the pixels are interconnected.
  - However, pixels far apart have no significant meaning…
  - By connecting only the nearing neighbors, computational load could be much lower.

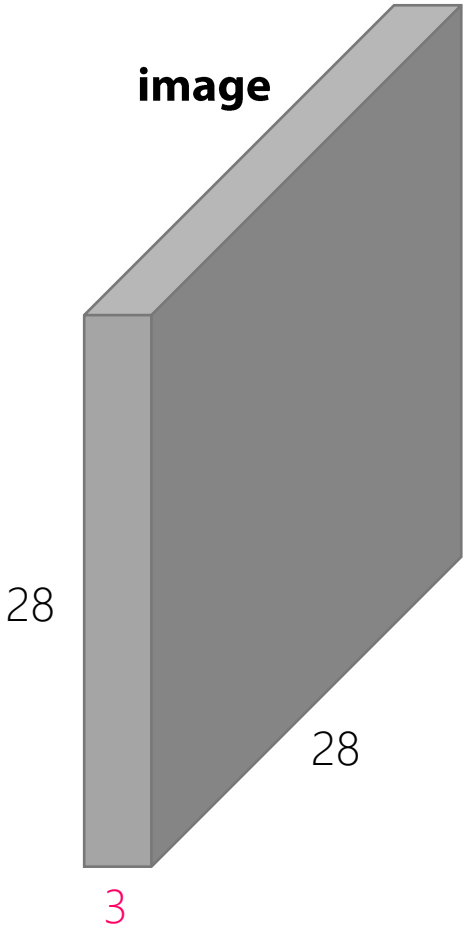
Convolution Layer

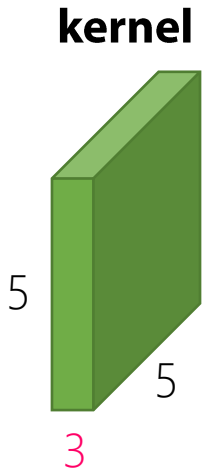


Convolution Layer



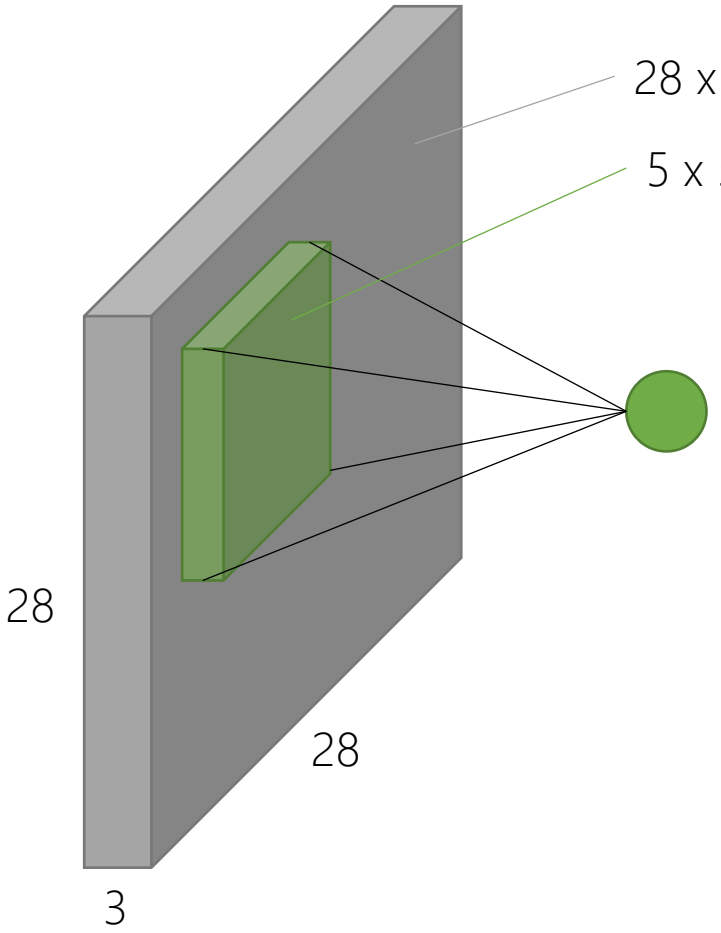
Convolution Layer





Convolve the kernel with the image!
In other words…
"slide the kernel over the image, compute dot products each time."

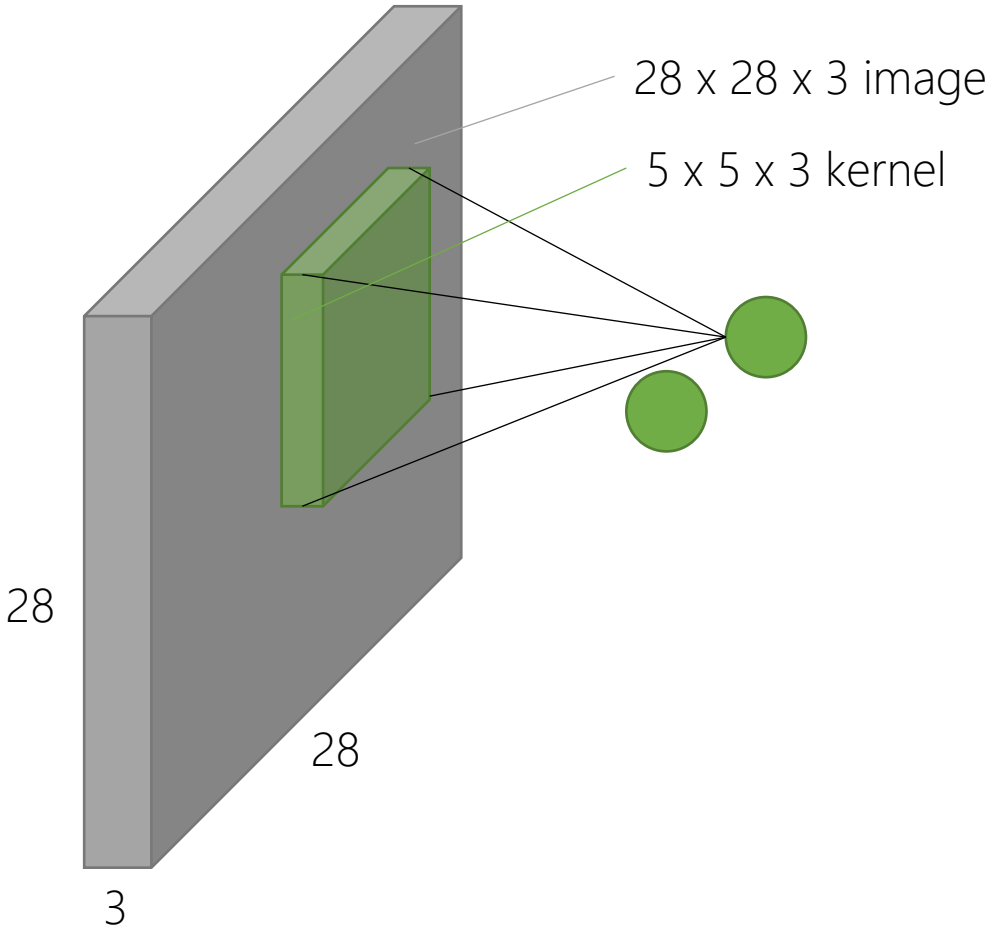
Convolution Layer



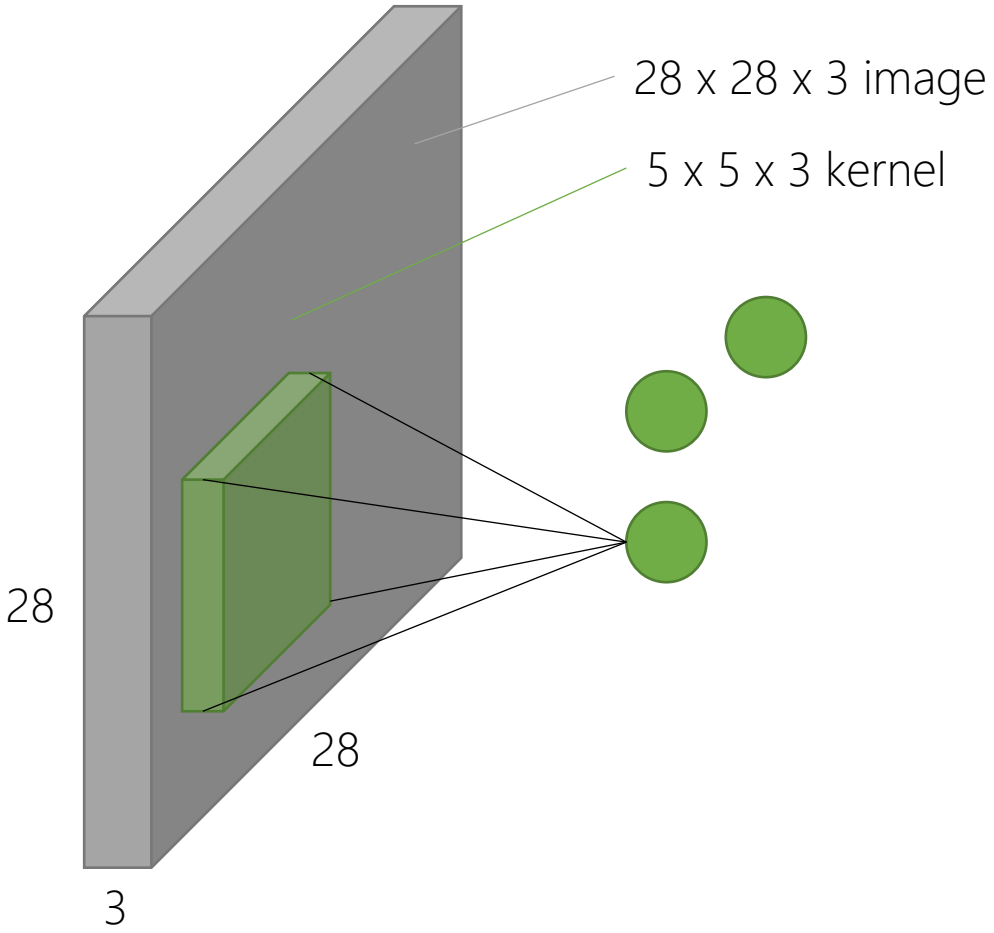
1 number as a result of taking dot product between the kernel and a small 5 x 5 x 3 chunk of the image, plus bias:

$$w^T x + b$$

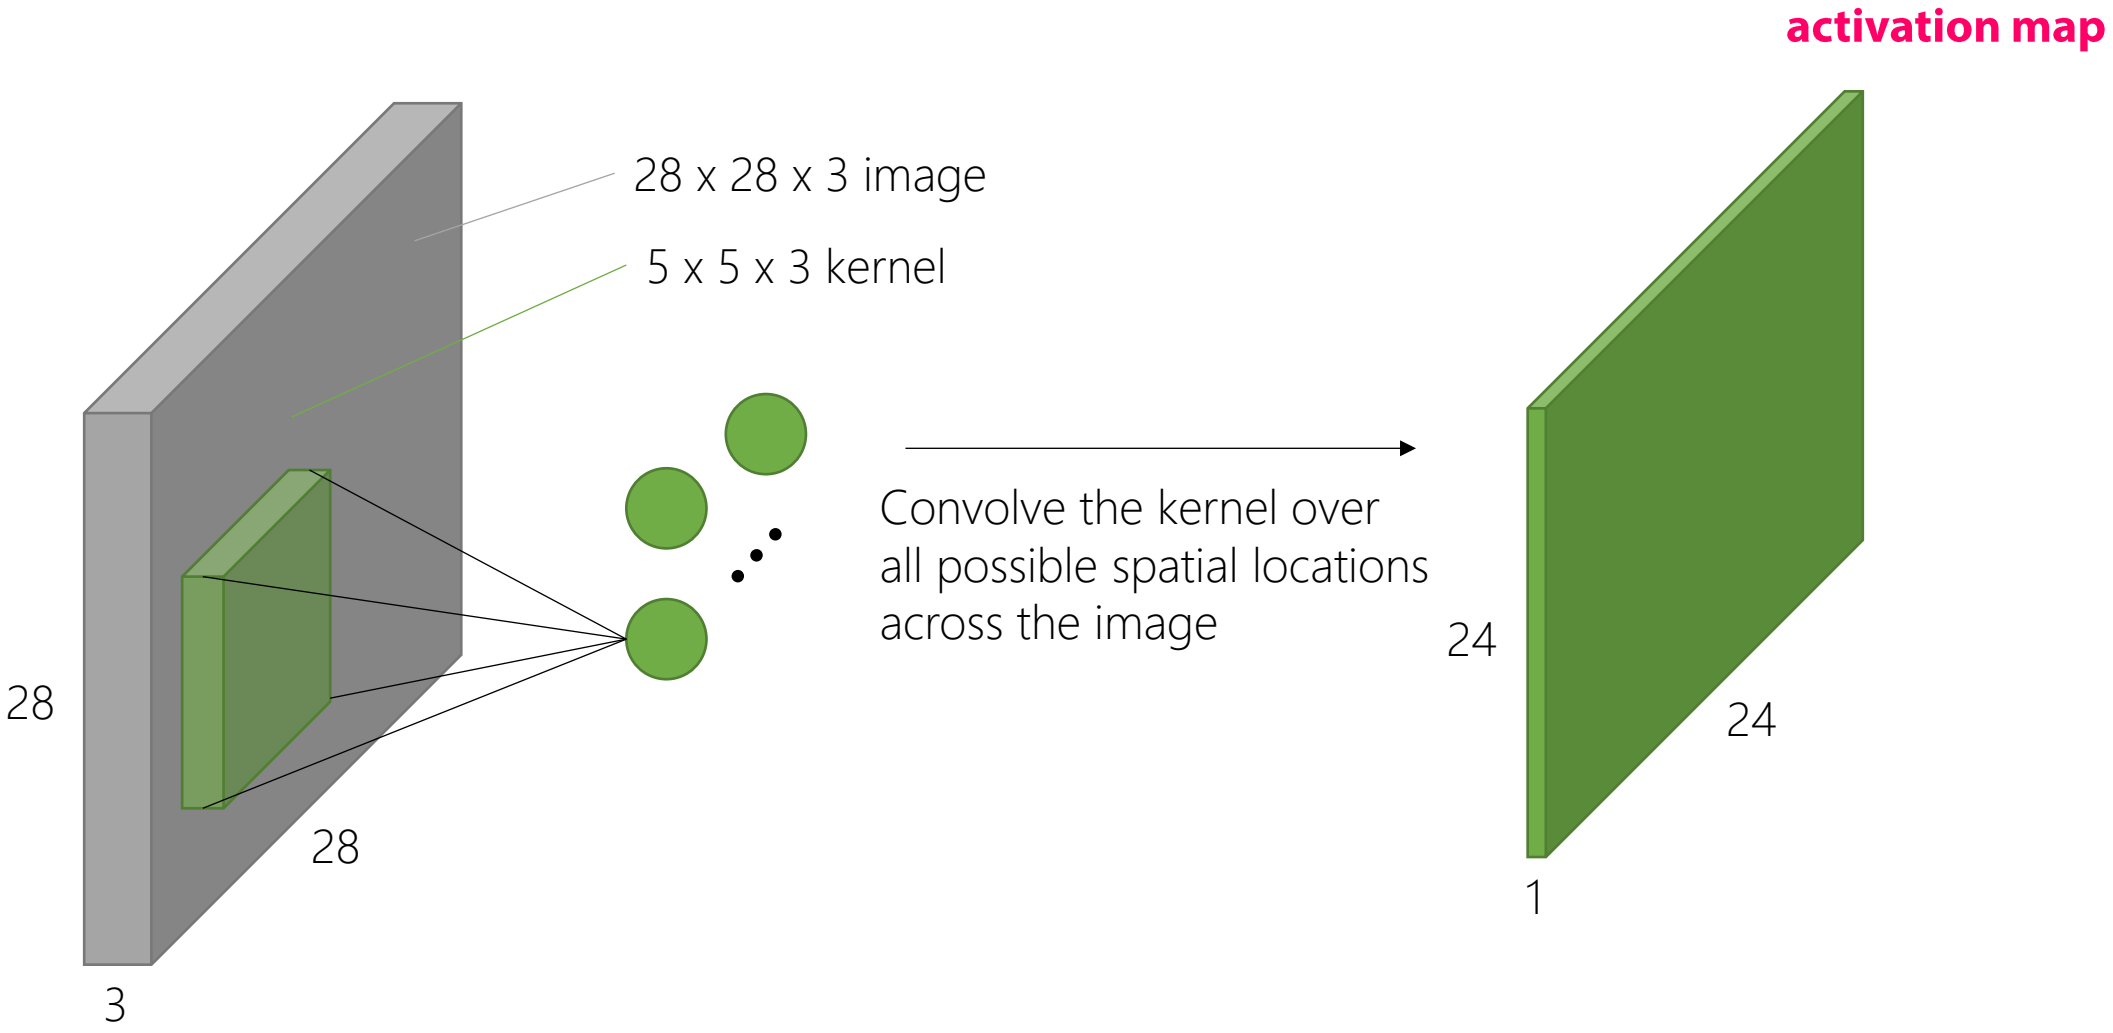
Convolution Layer



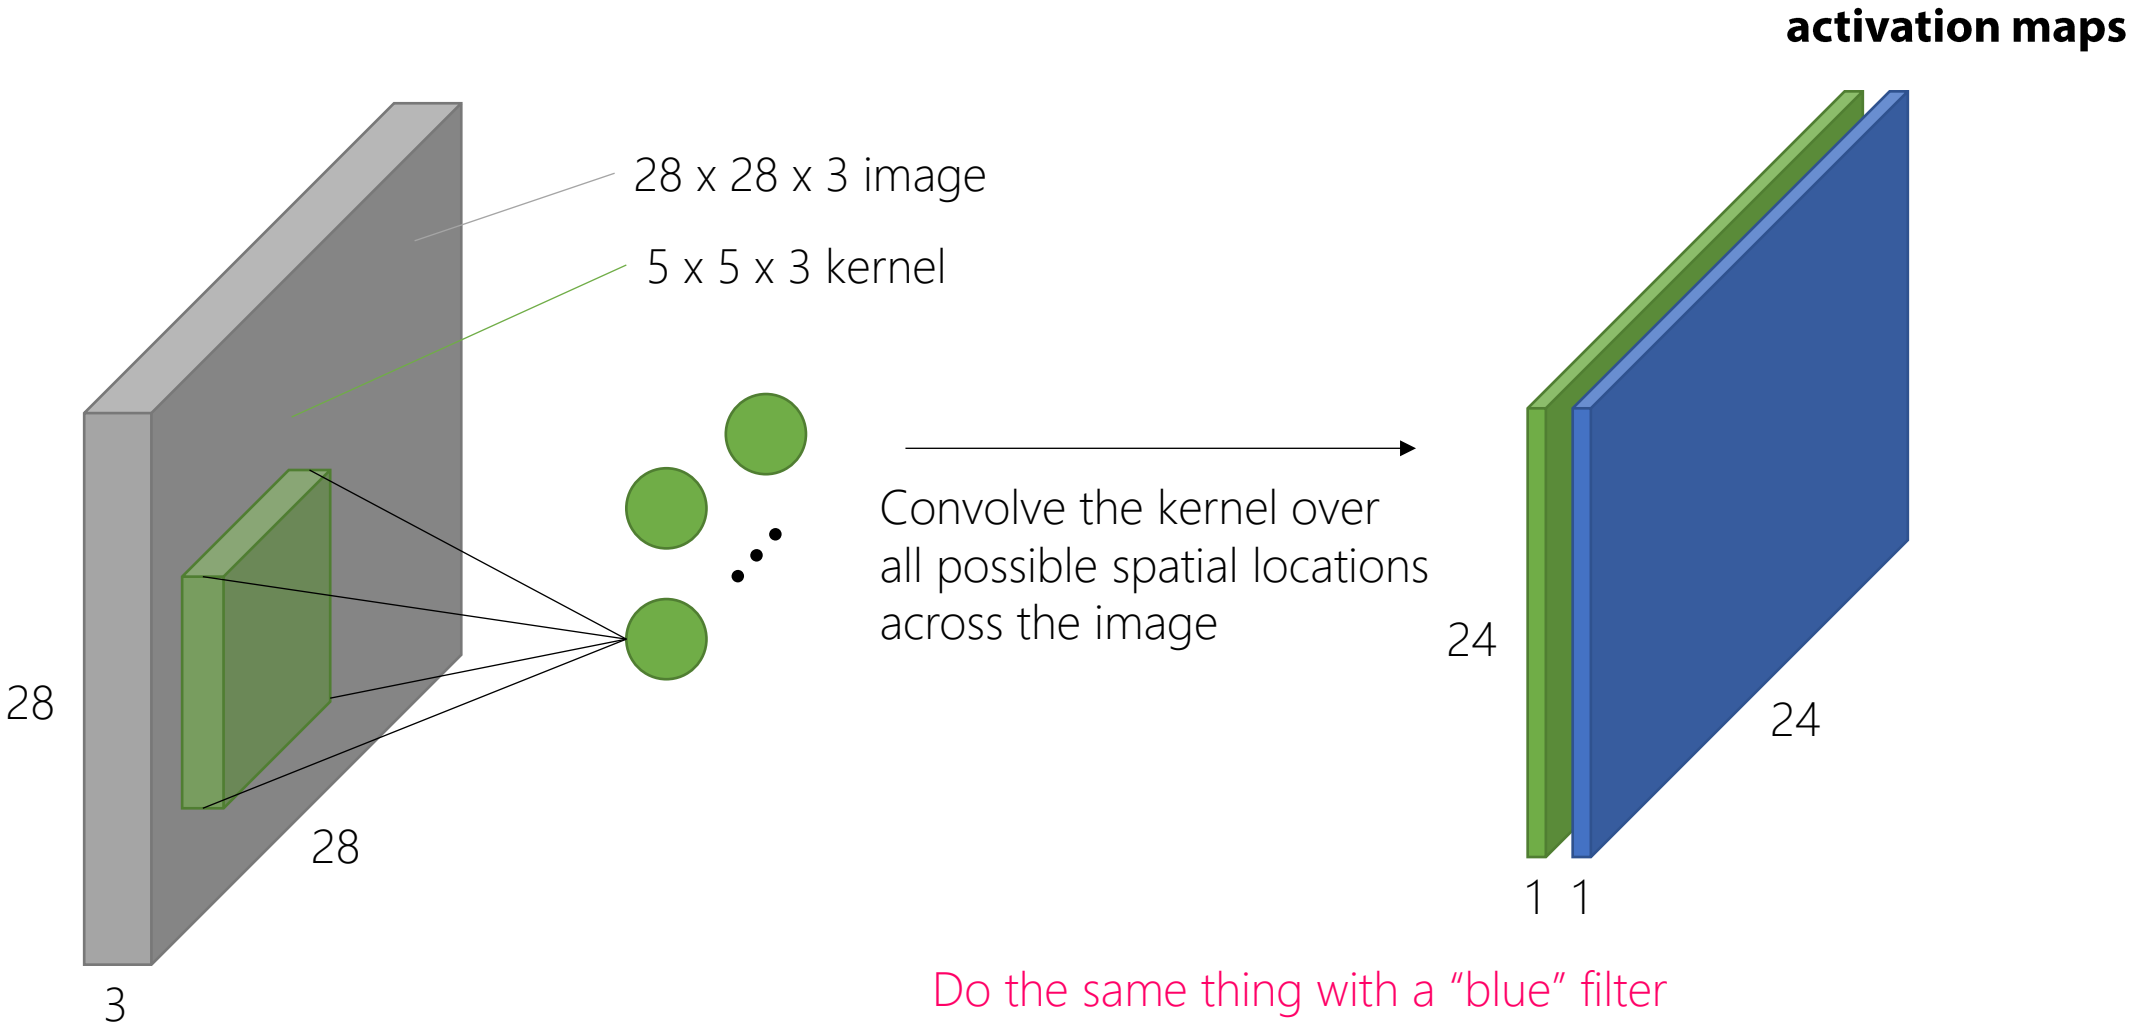
Convolution Layer



Convolution Layer

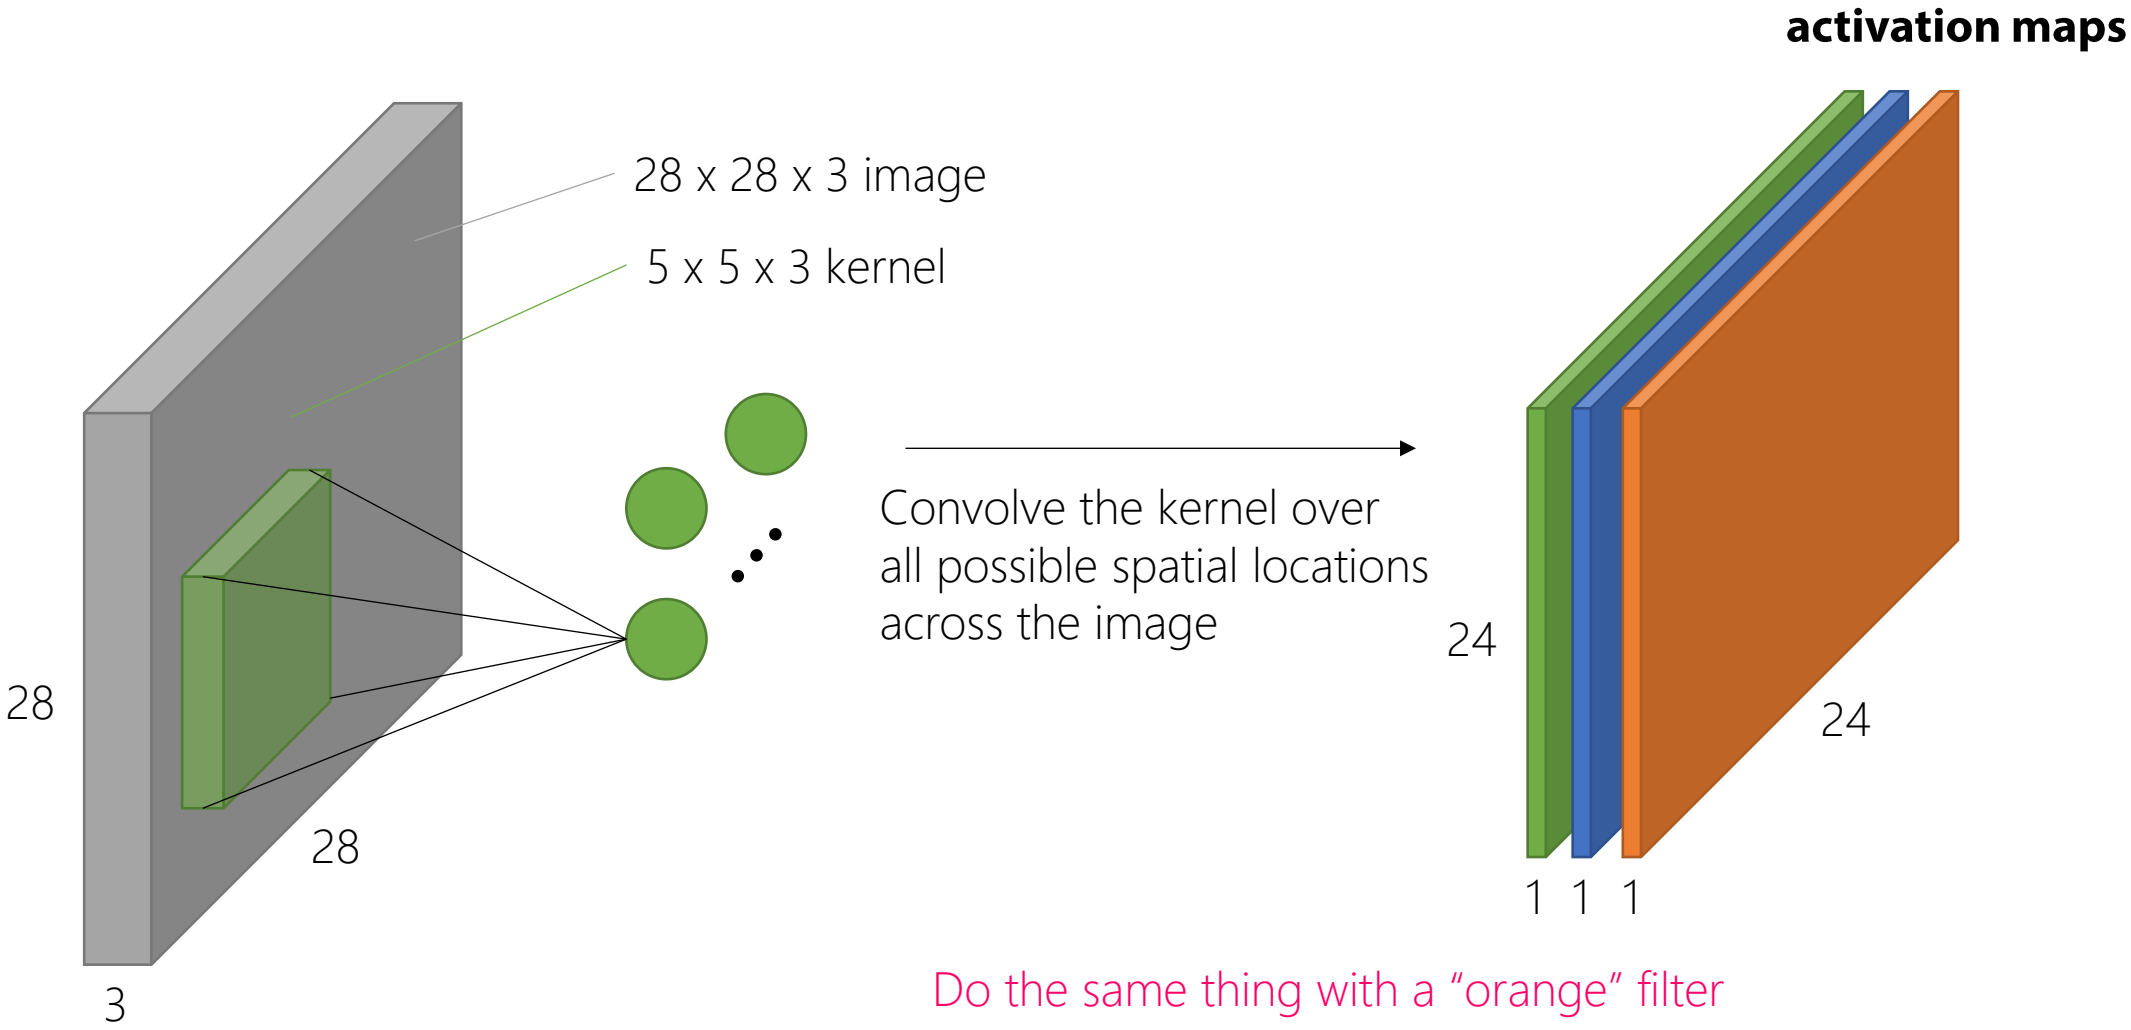


Convolution Layer



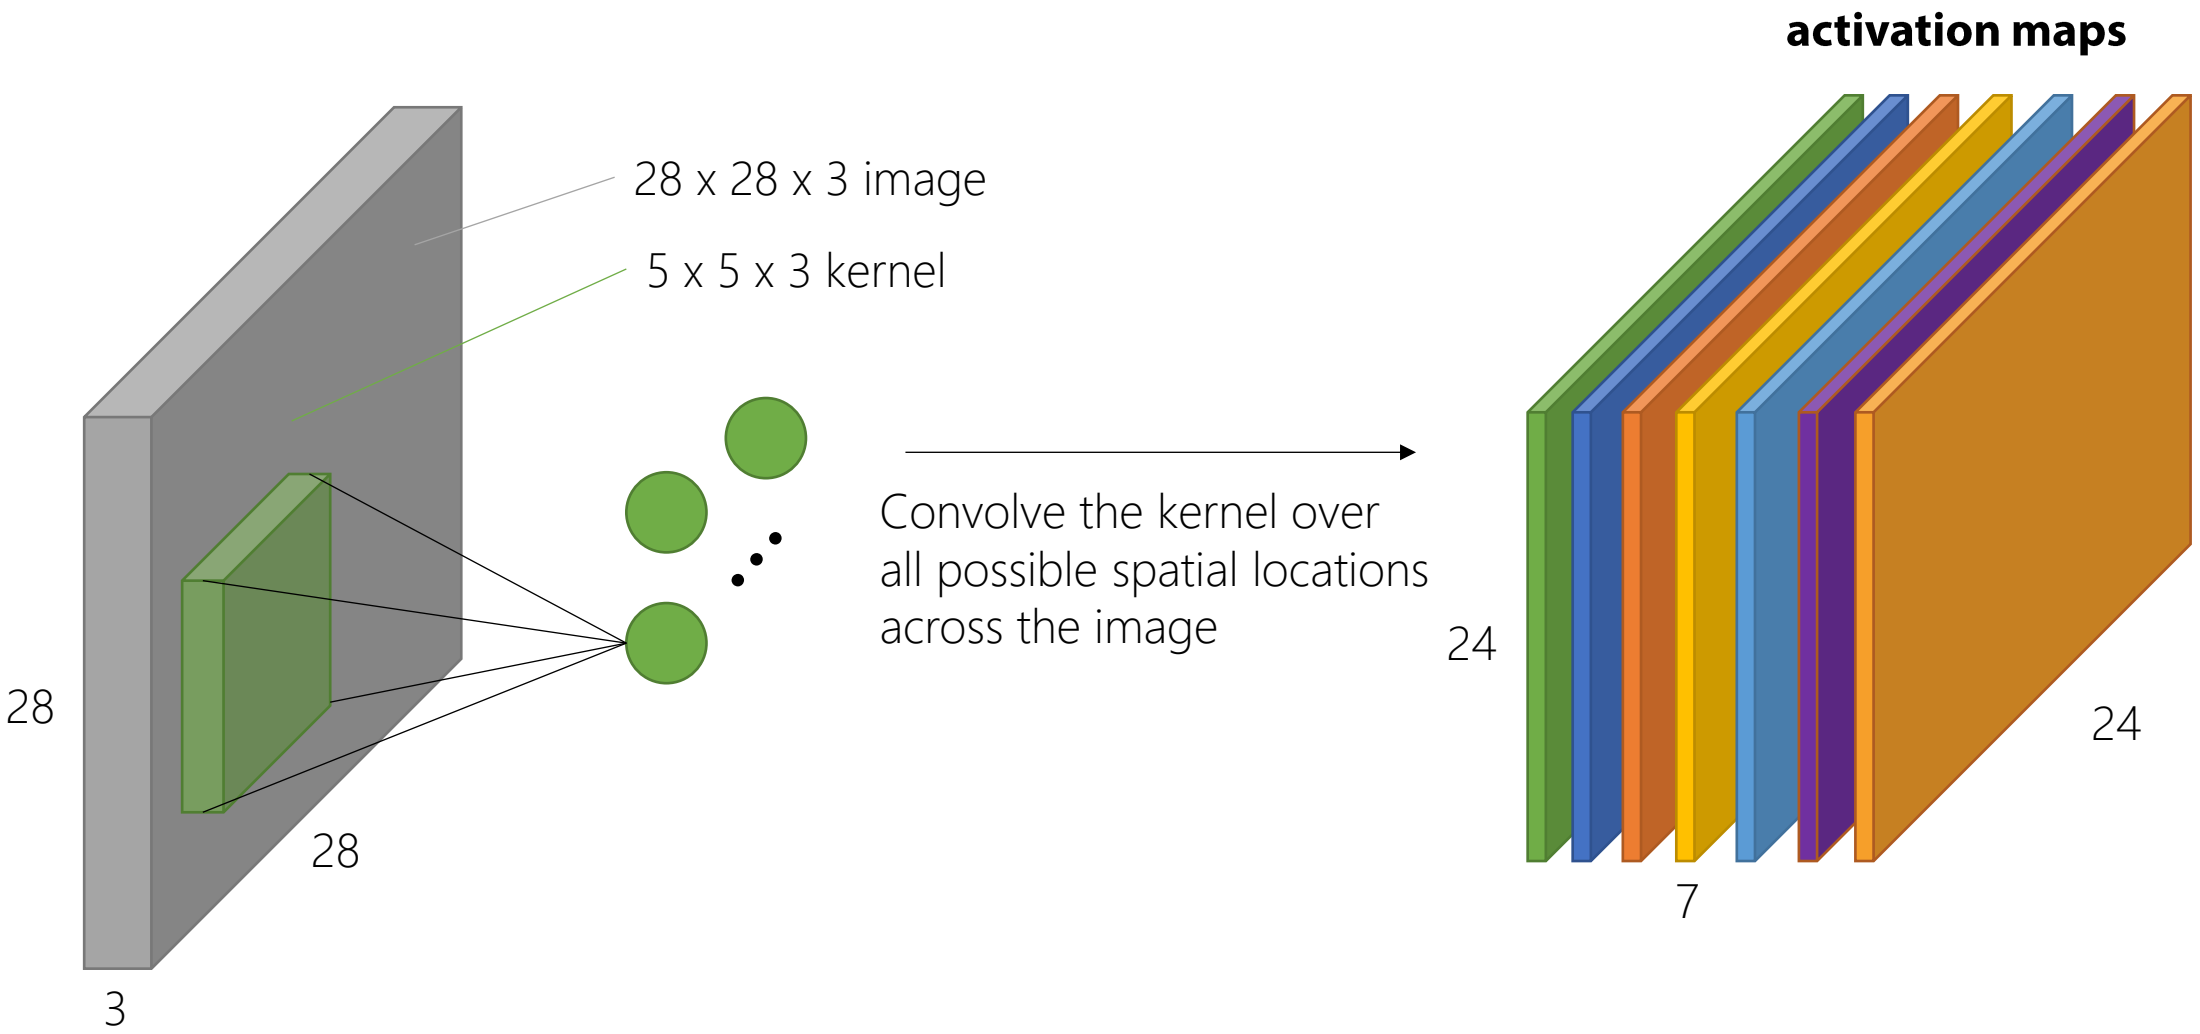
Do the same thing with a “blue” filter

Convolution Layer

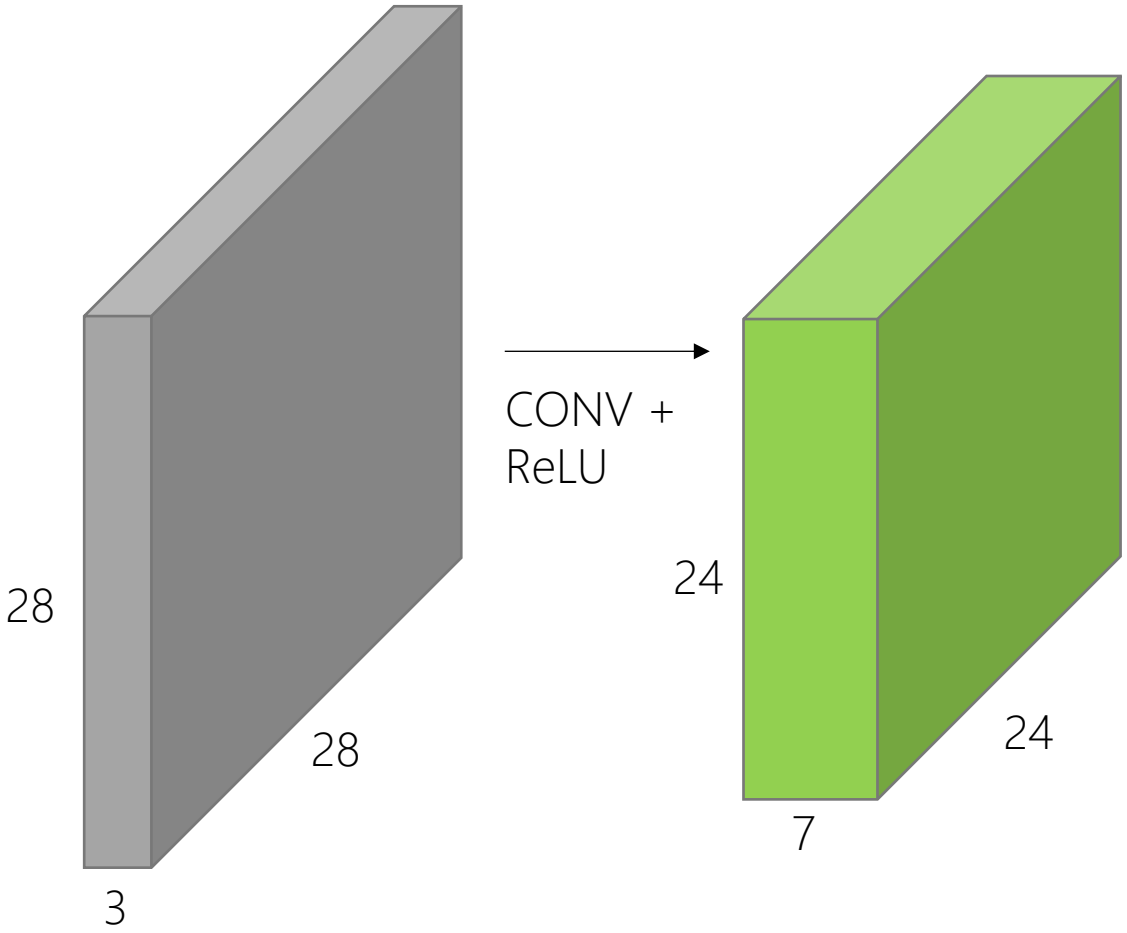


Do the same thing with a "orange" filter

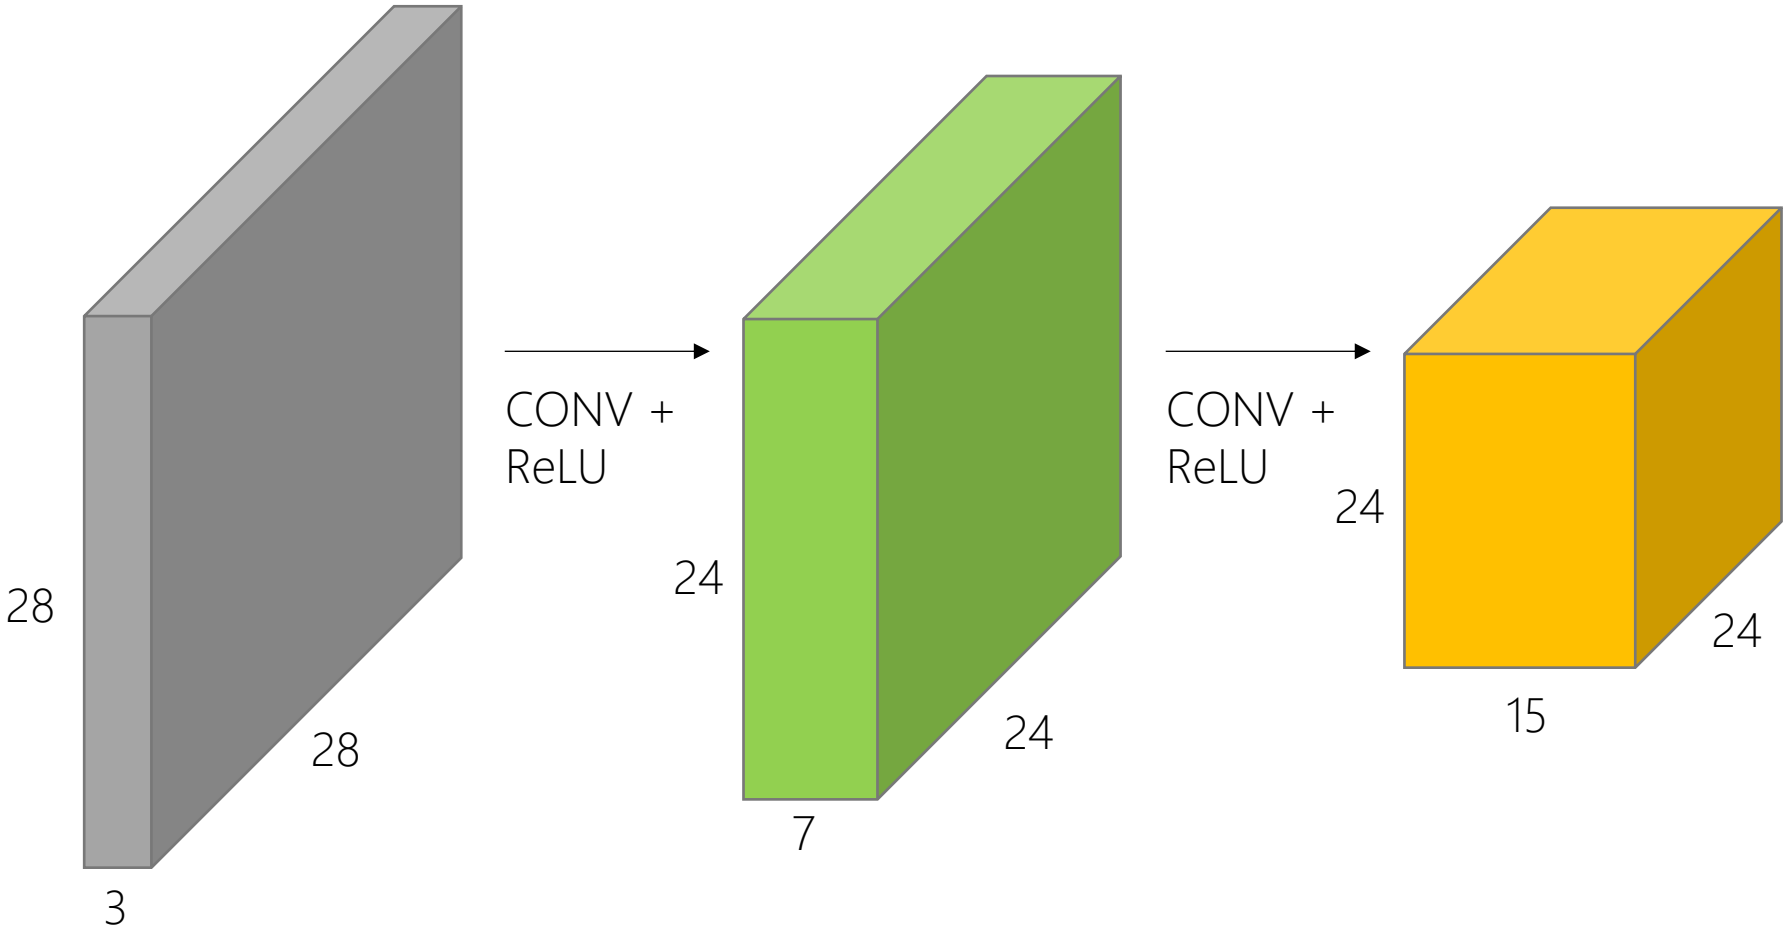
Convolution Layer



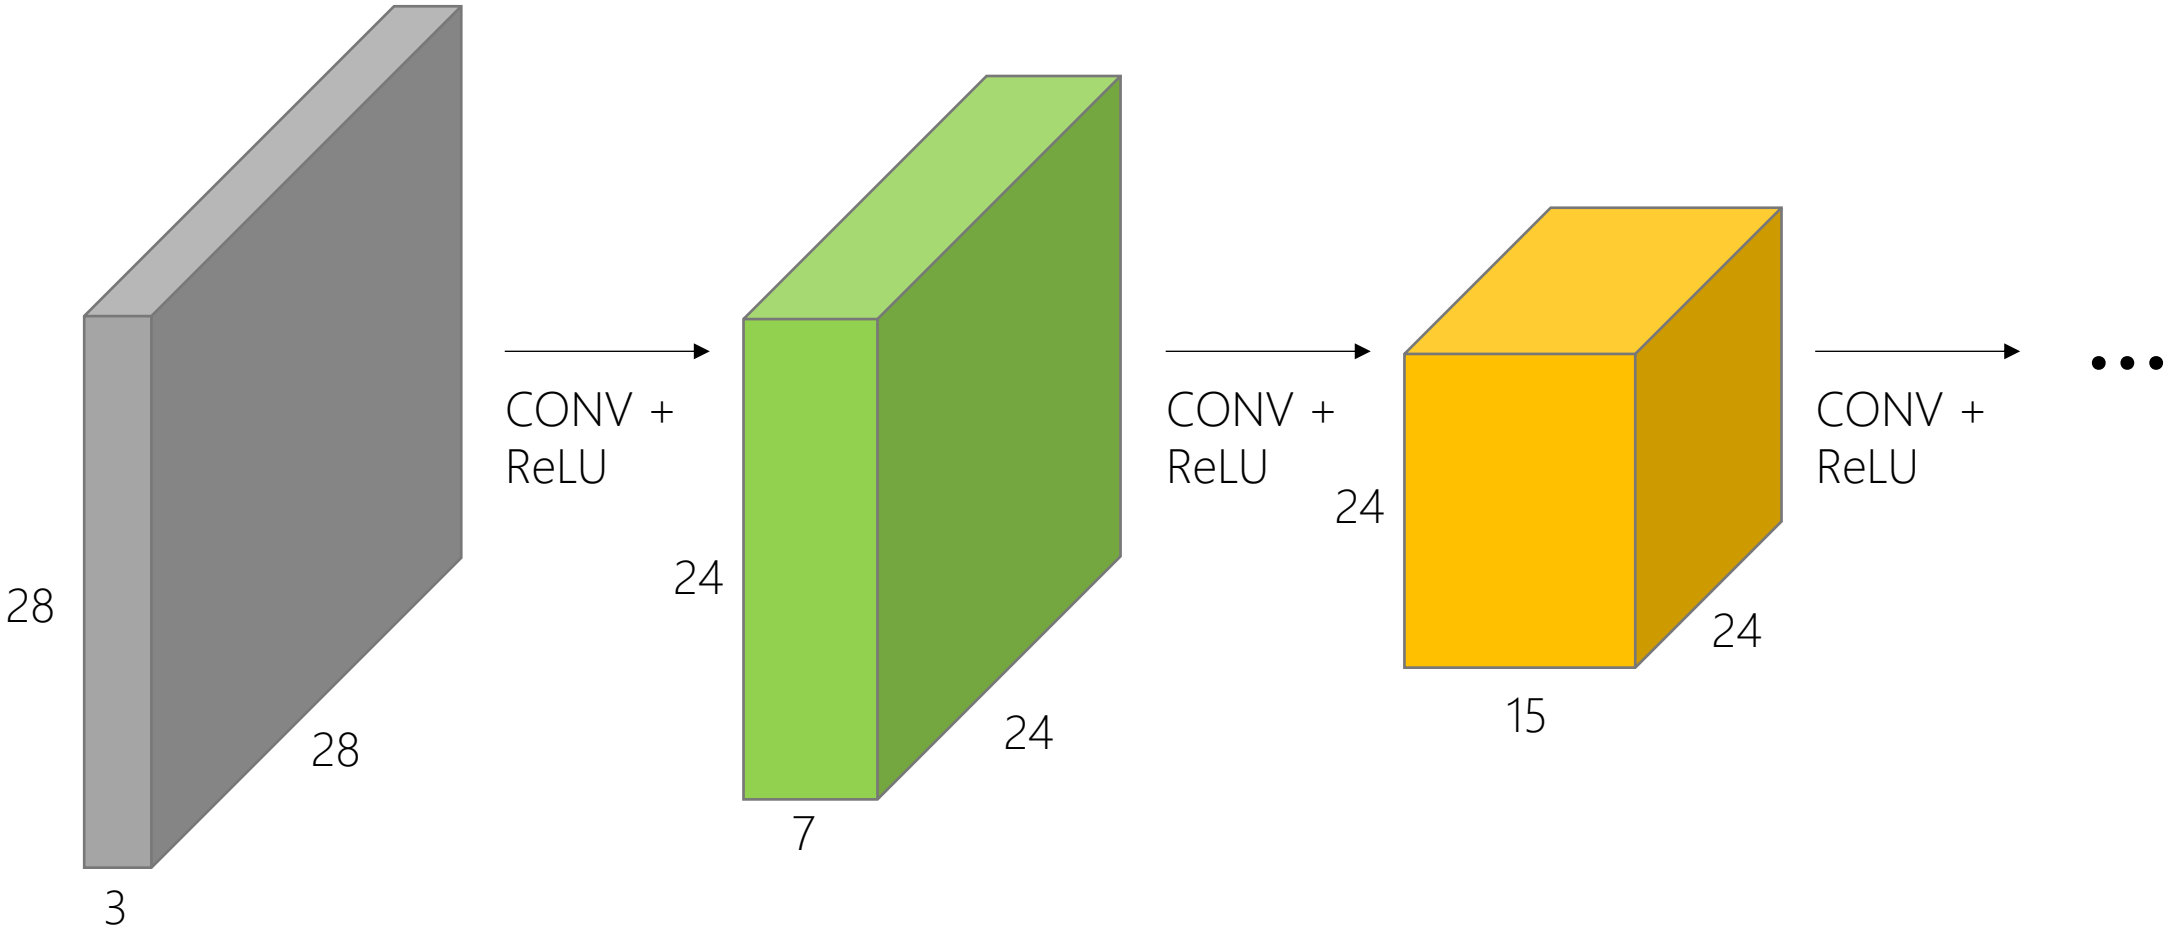
ConvNet is a sequence of convolution layers

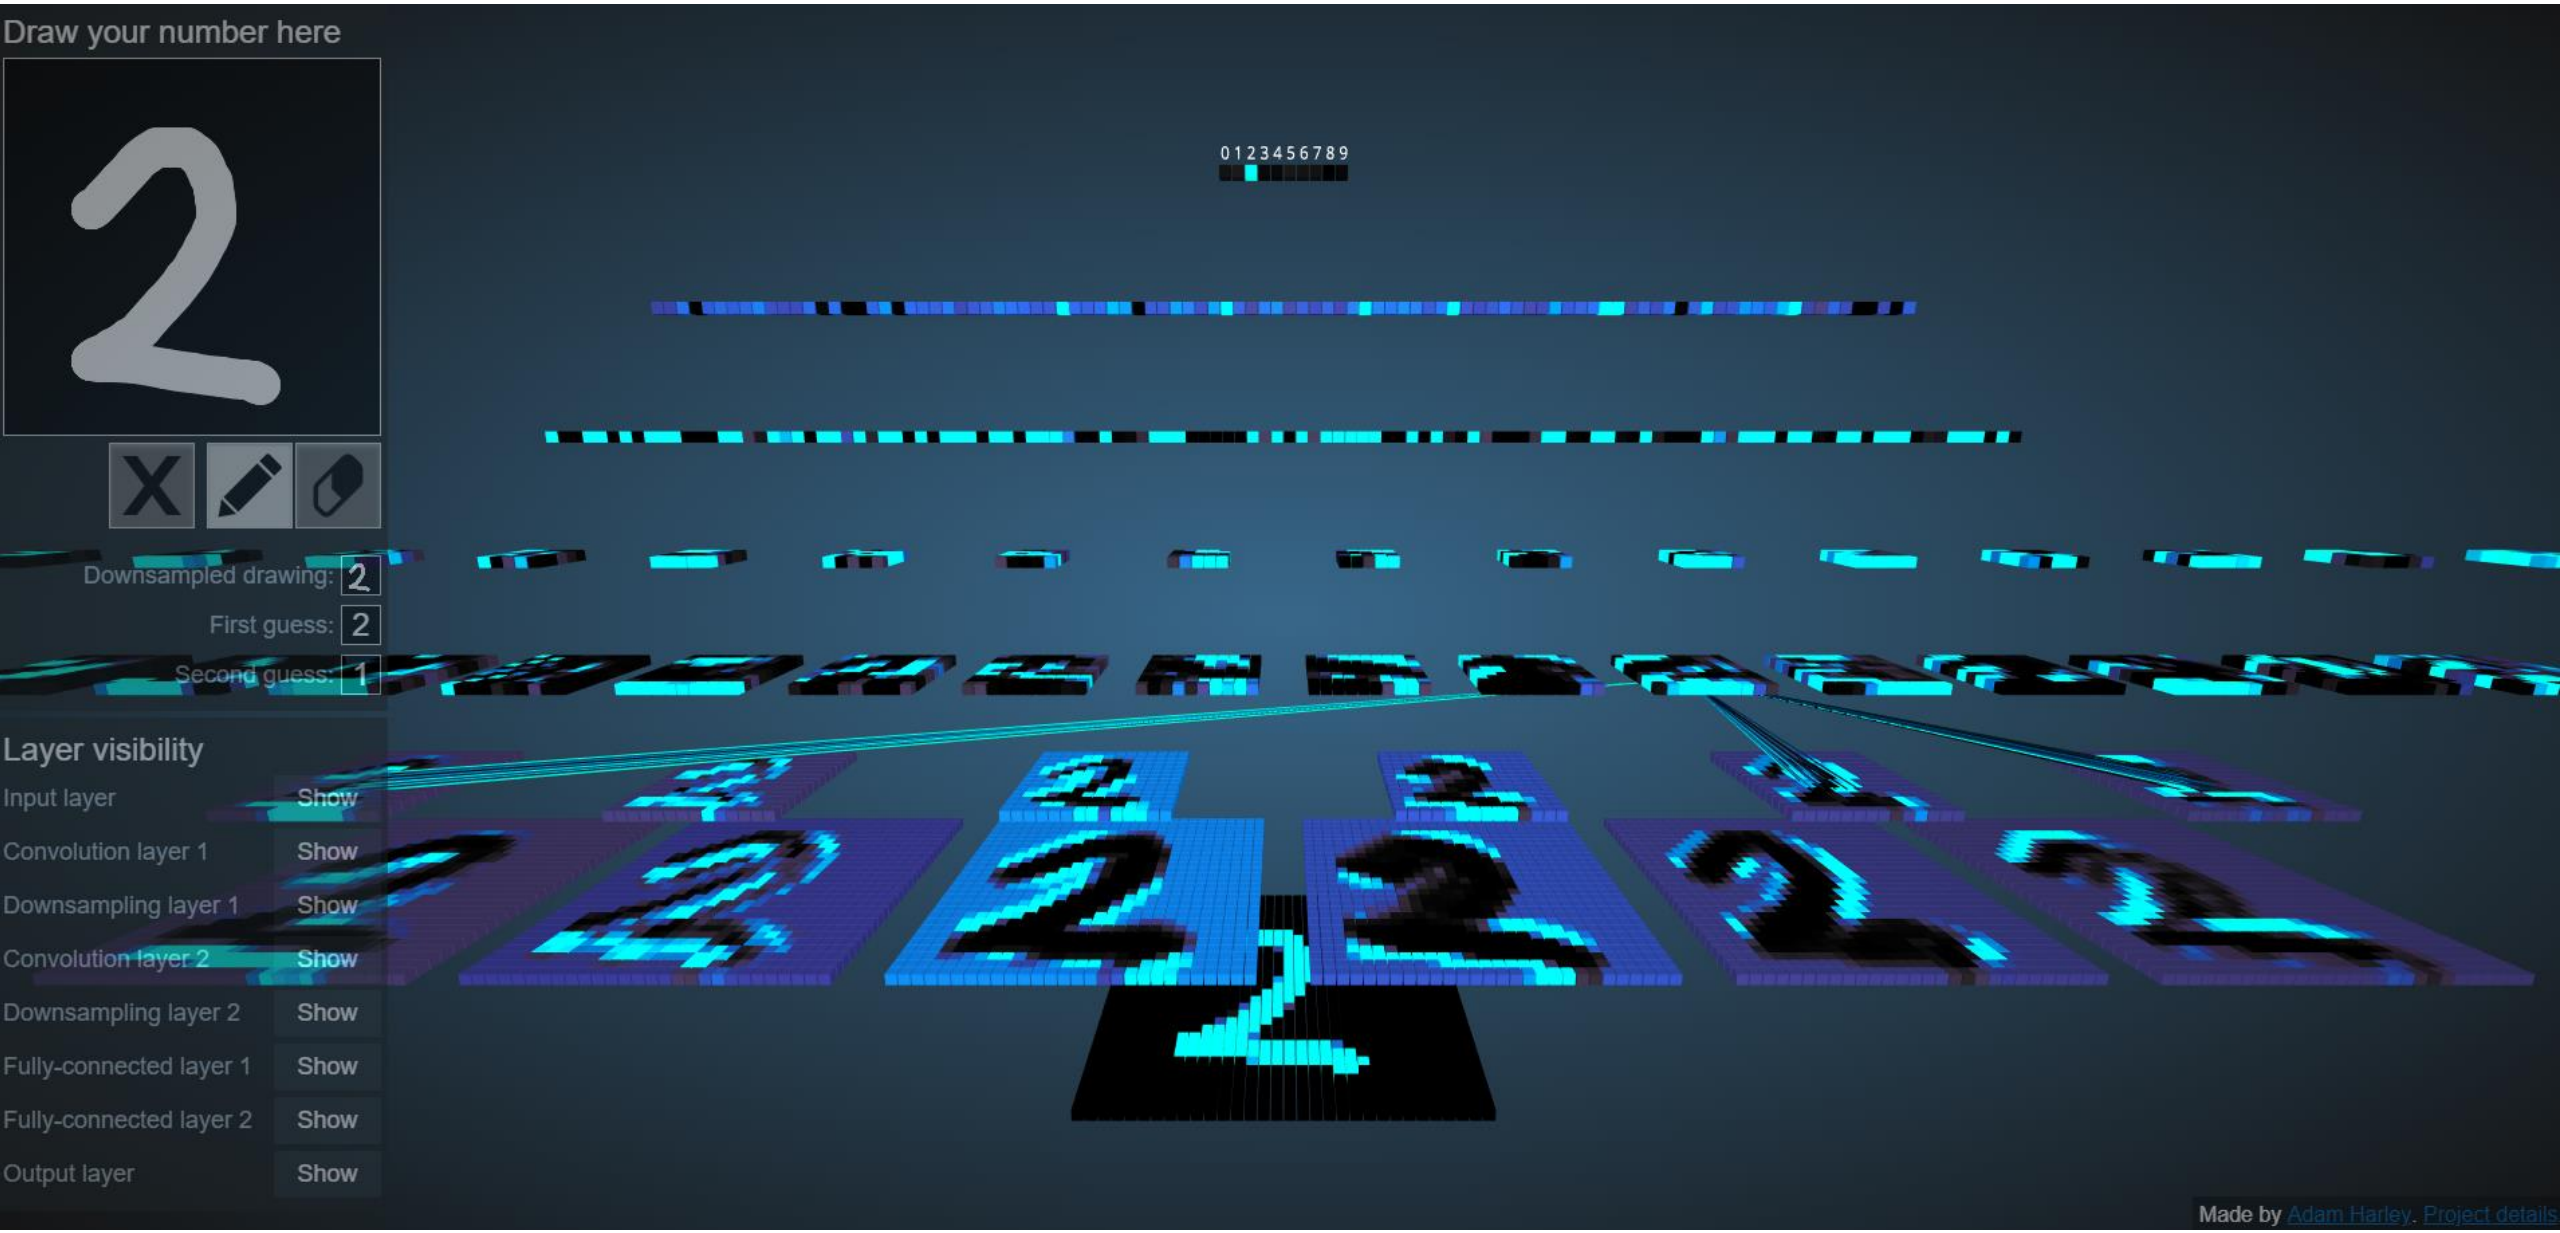


ConvNet is a sequence of convolution layers



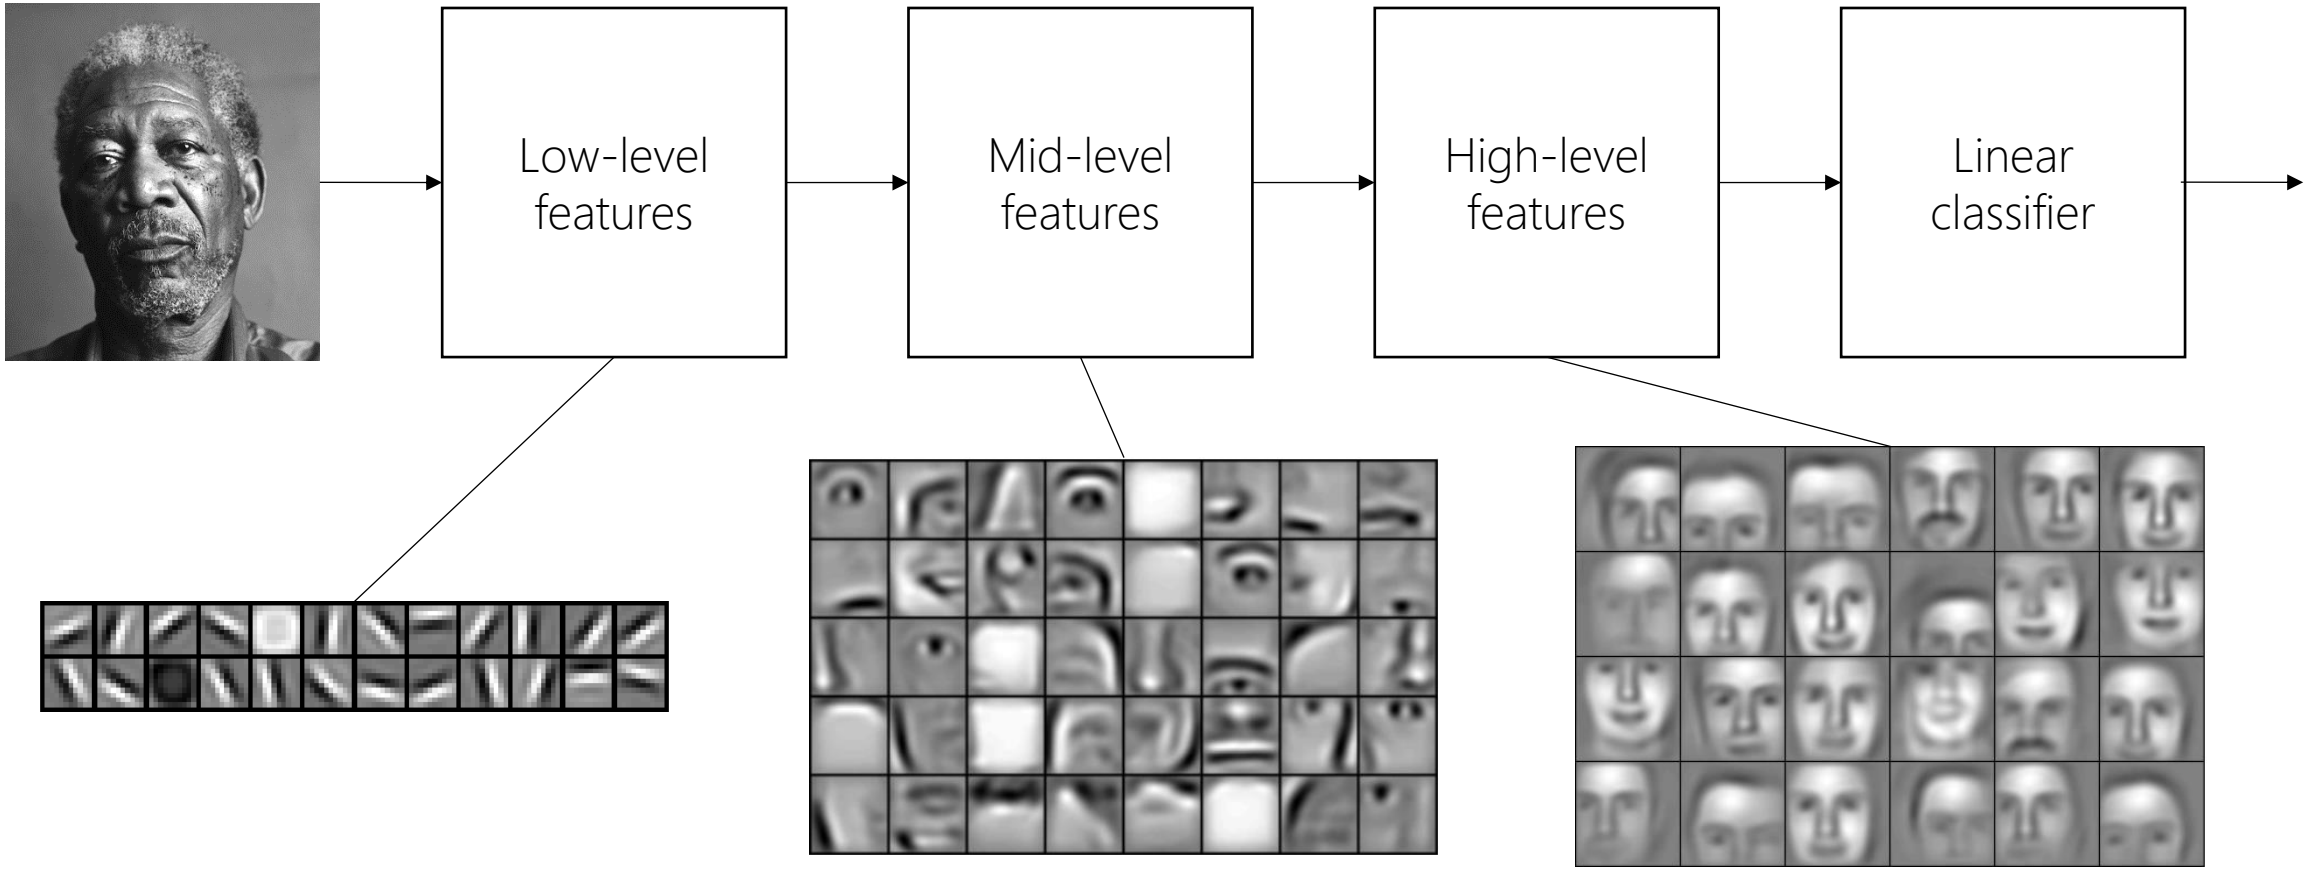
ConvNet is a sequence of convolution layers





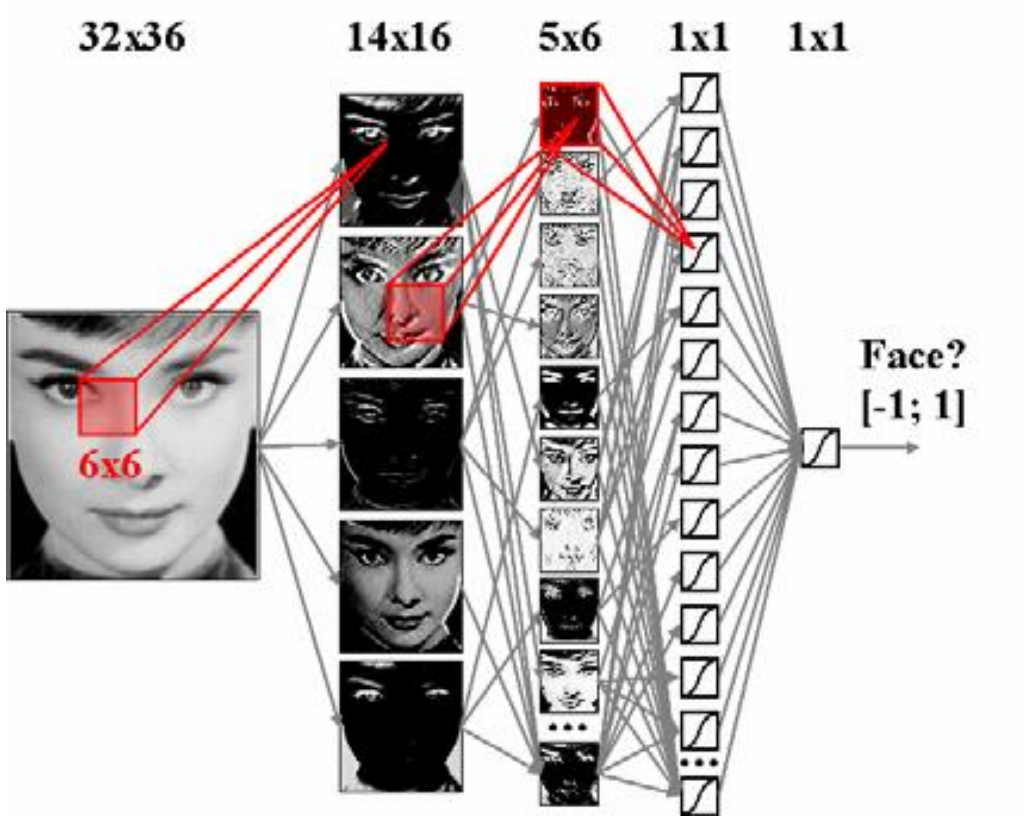
http://scs.ryerson.ca/~aharley/vis/conv/

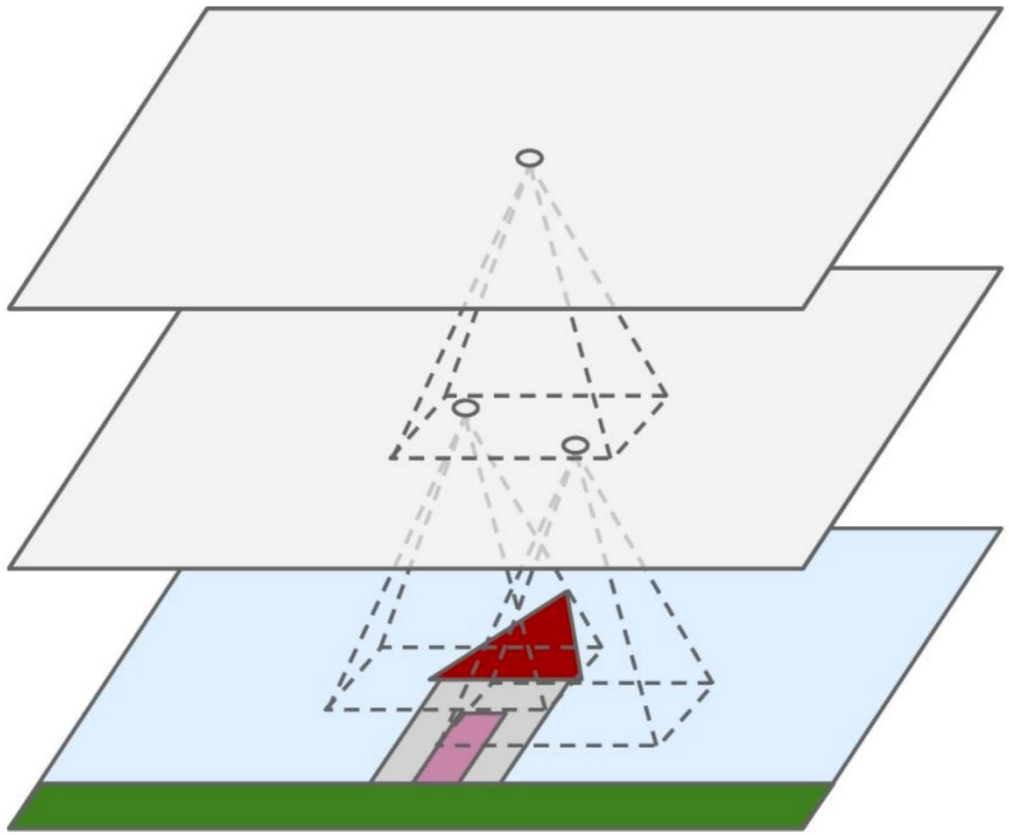
ConvNet is a sequence of convolution layers



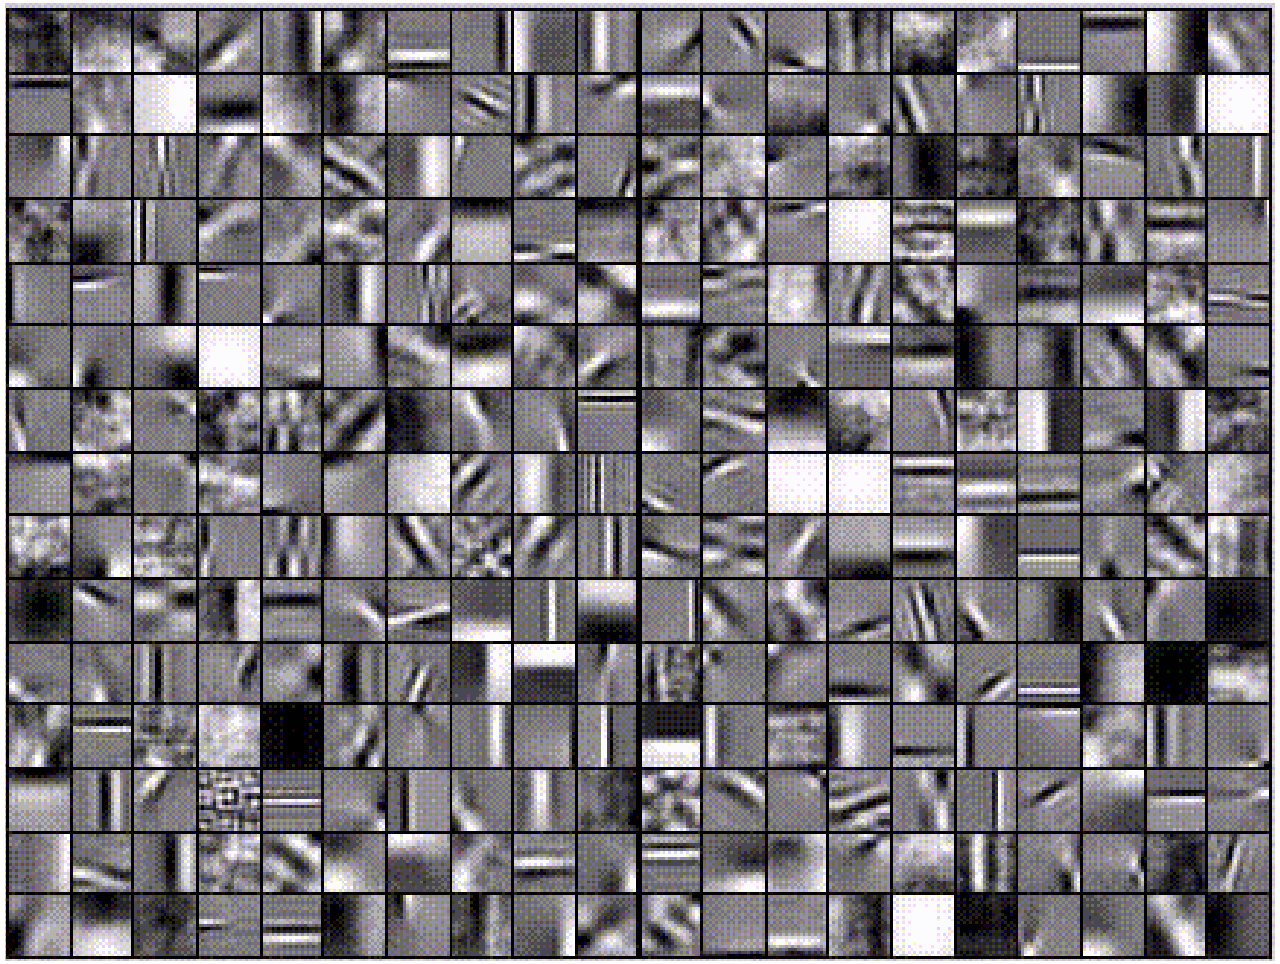
Lee *et al.* (2009)

ConvNet is a sequence of convolution layers





Conv kernels are trainable



A closer look…

- Convolution

$$(f * g)(t) \coloneqq \int_{-\infty}^{\infty} f(\tau) g(t-\tau)\, d\tau$$

Q. 7x7 input, 3x3 kernel, with stride 1, padded with 1 pixel. Output size?

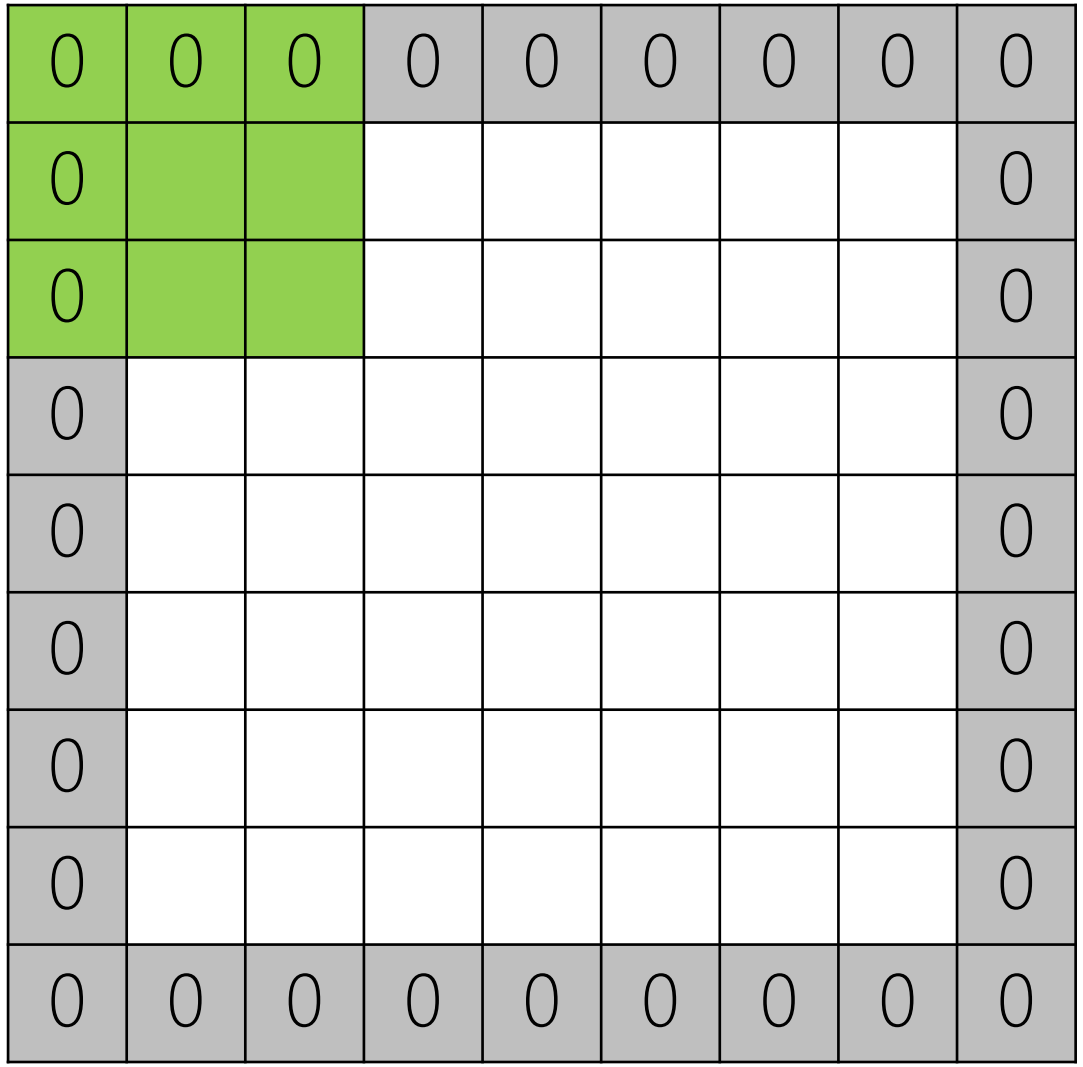
→ 7x7

Stride & Padding



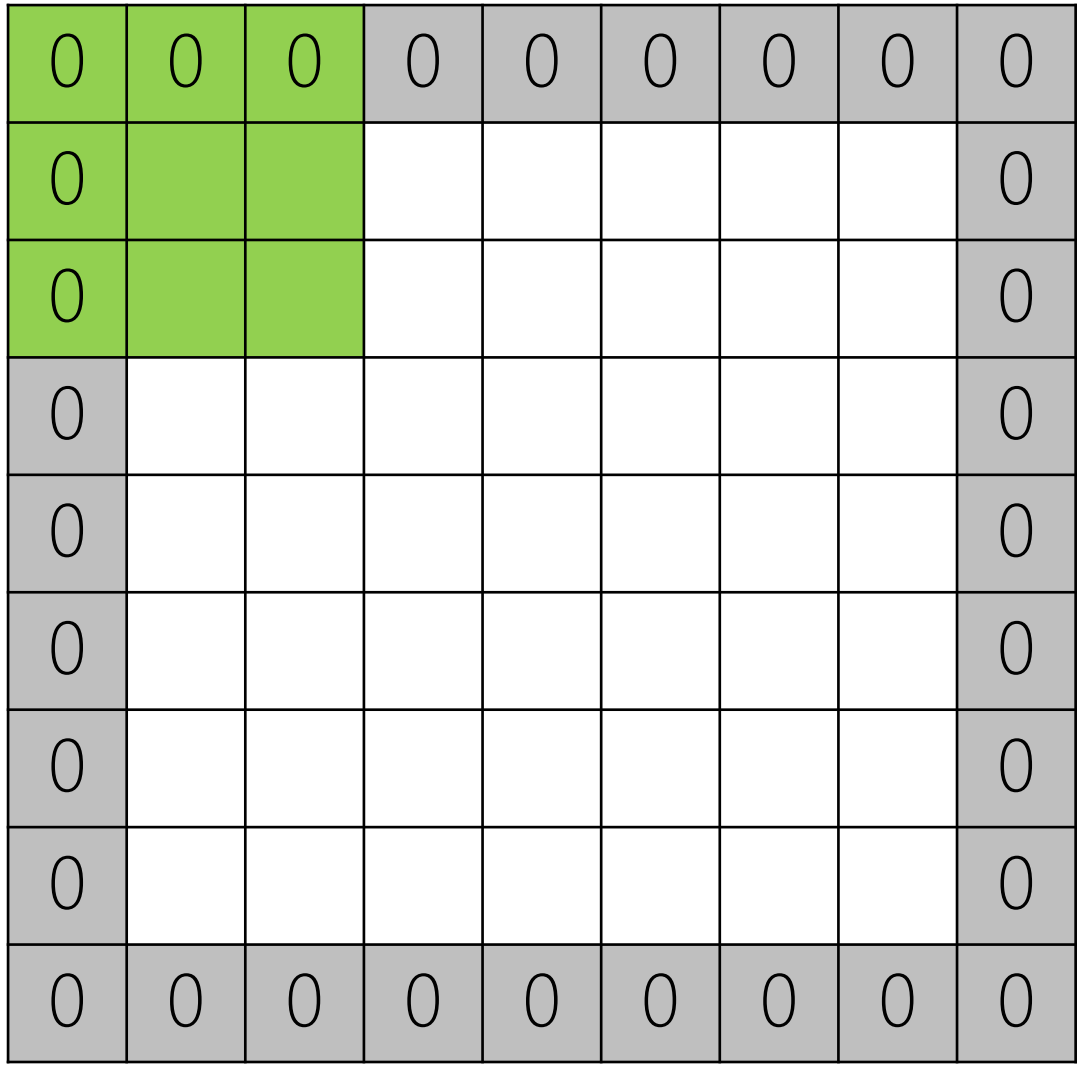
Output size:
(N-f)/stride + 1

Q. 7x7 input, 3x3 kernel, with stride 1, padded with 1 pixel. Output size?

→ 7x7

Q. 7x7 input, 3x3 kernel, with stride 3. You want to make 3x3 output, padding?

Stride & Padding



Output size:
(N-f)/stride + 1

Q. 7x7 input, 3x3 kernel, with stride 1, padded with 1 pixel. Output size?

→ 7x7

Q. 7x7 input, 3x3 kernel, with stride 3. You want to make 3x3 output, padding?

→ 1

Pooling Layers

- Pooling == ConvNet way of downsampling
- “Reduce the image size” to obtain smaller but more manageable features
- Receptive fields becomes relatively larger as the image size gets smaller
- Operates over each activation map independently

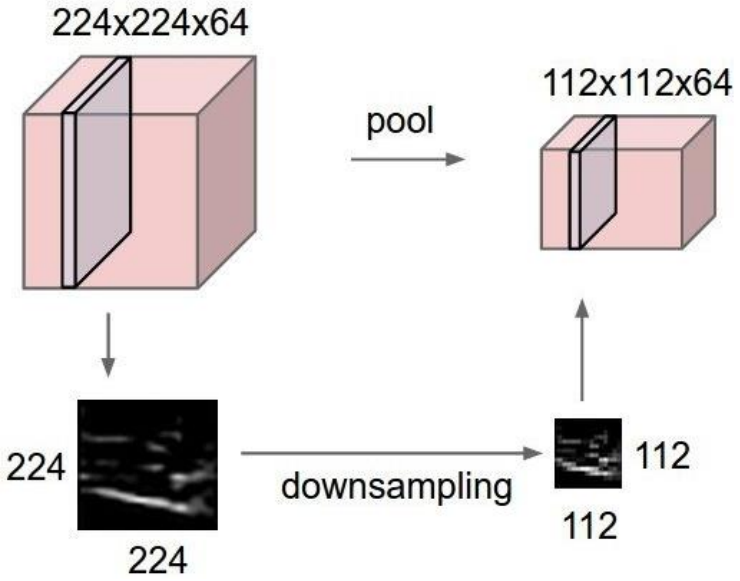


Image source: Stanford CS231n Convolutional Neural Networks for Visual Recognition

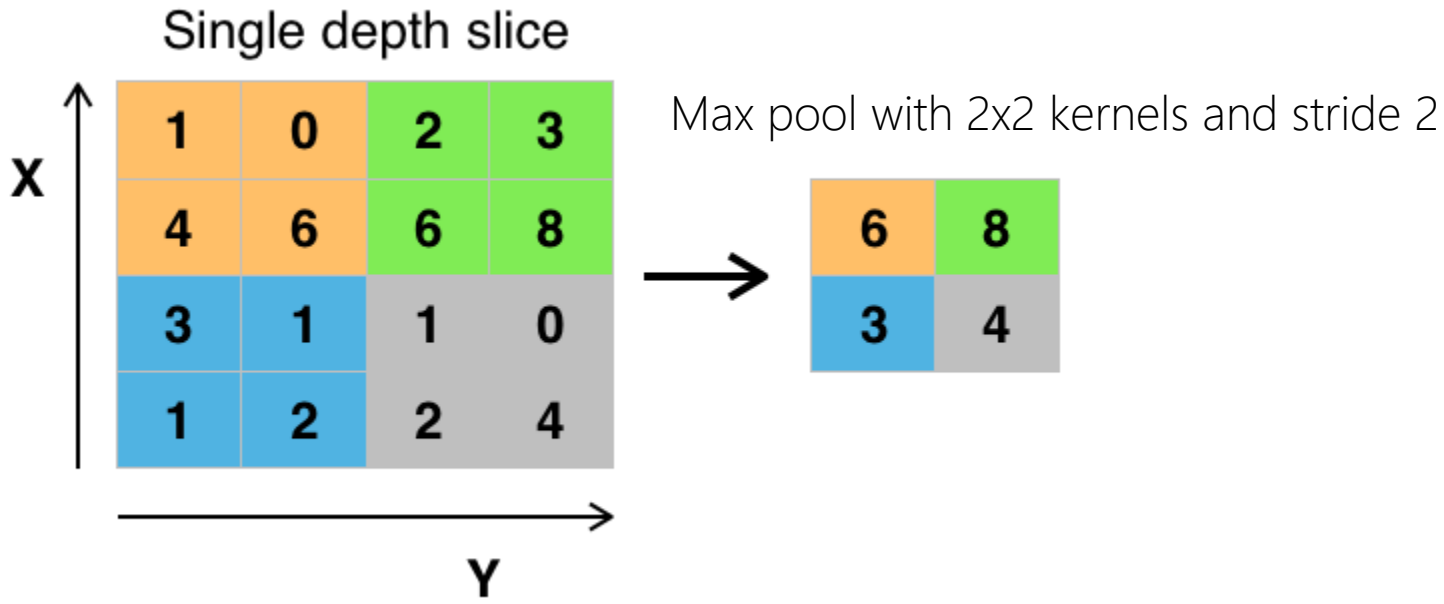
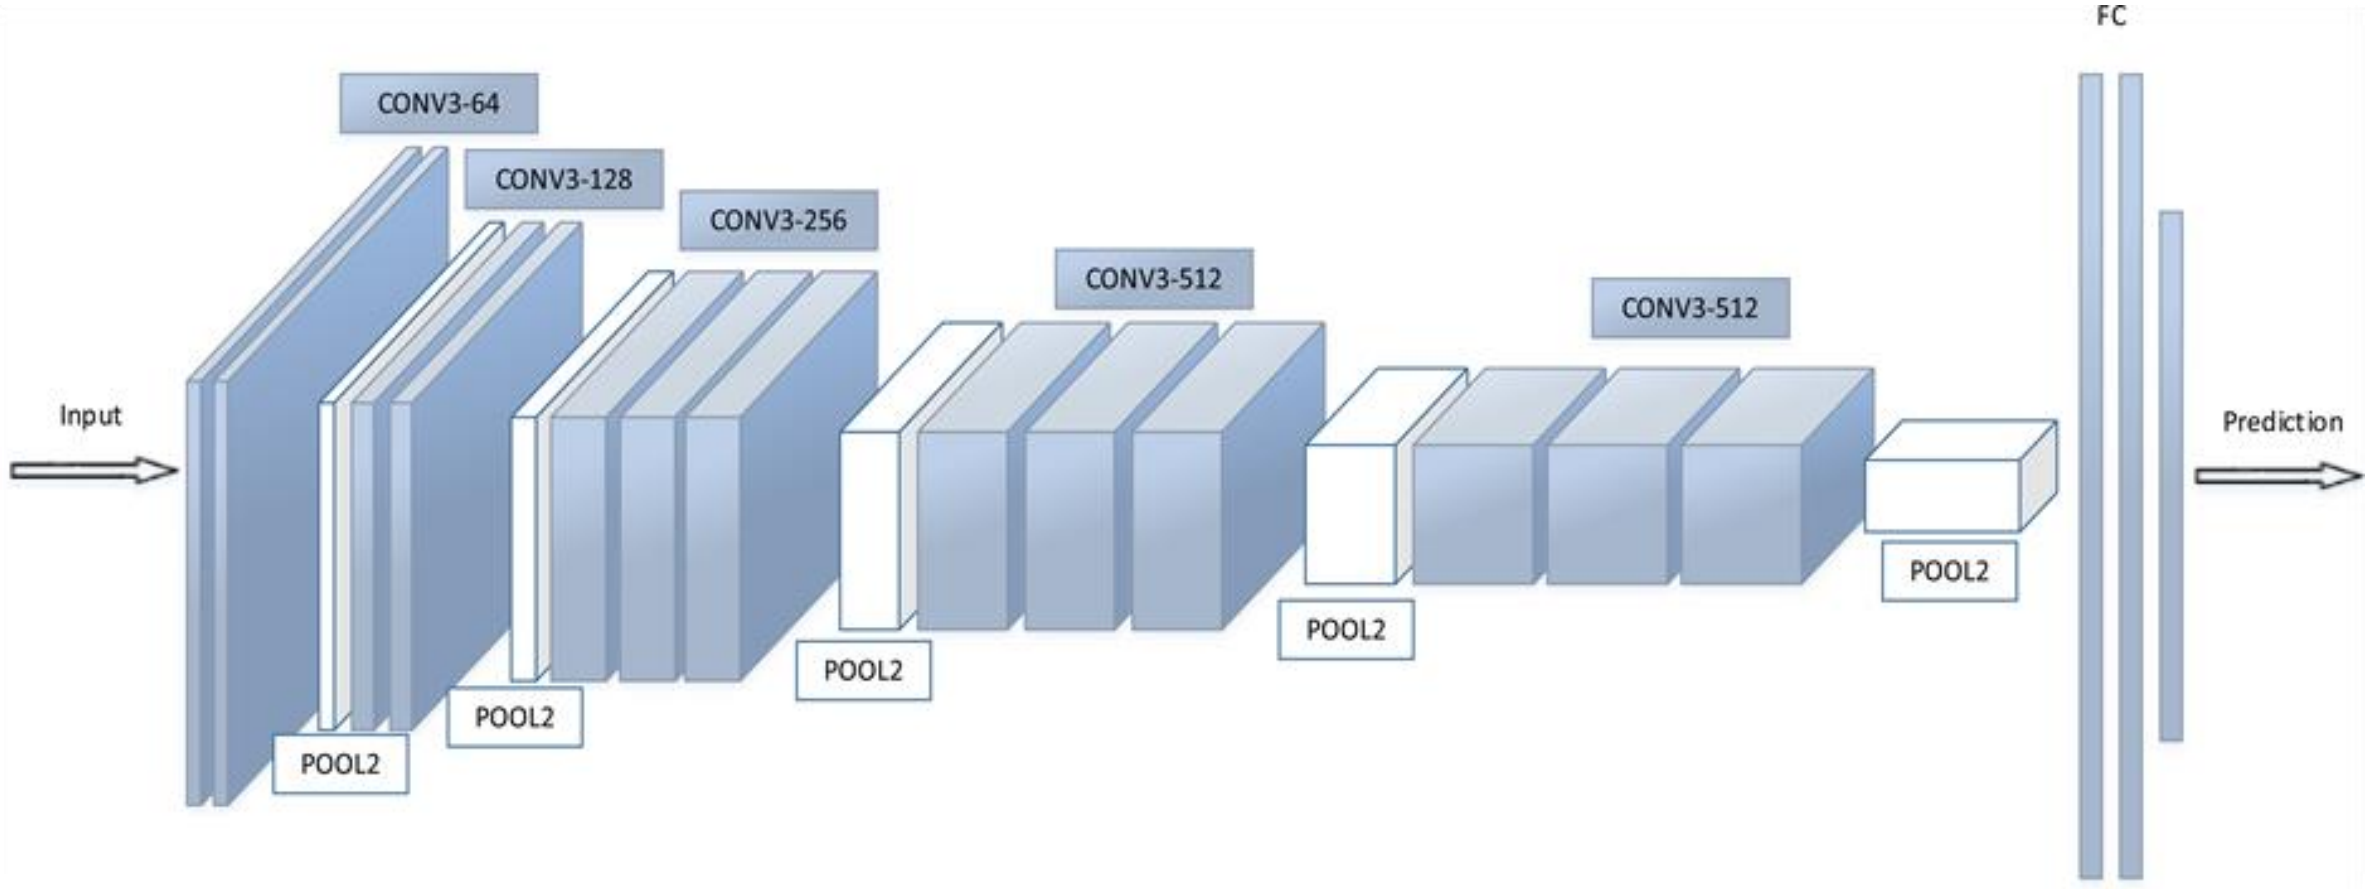
Max Pooling

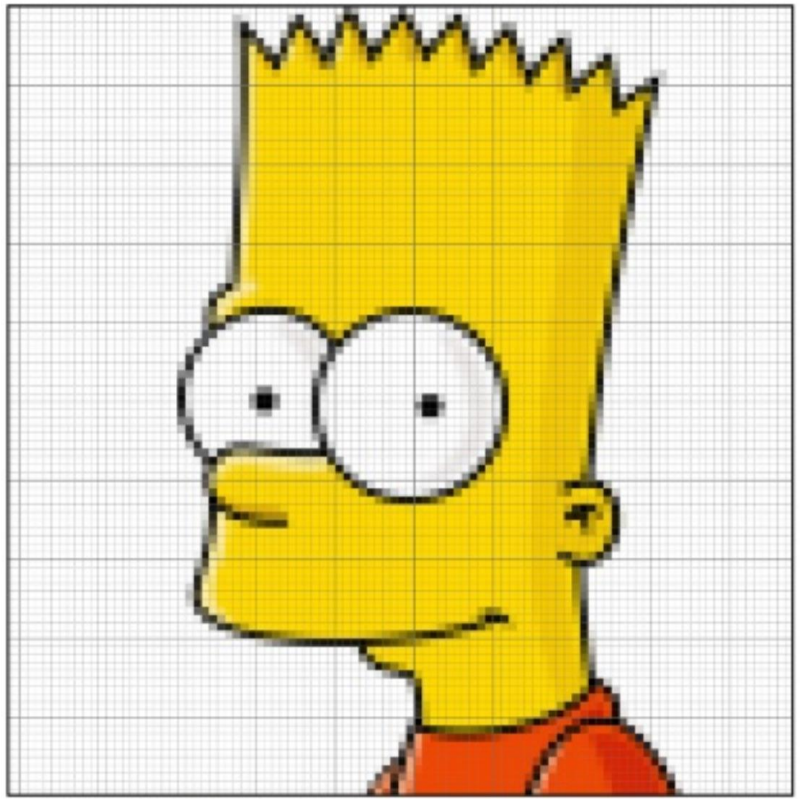
- A non-linear down-sampling method
- An image is partitioned into a set of (non-overlapping) rectangles.
- The maximum of each such sub-region is sampled.



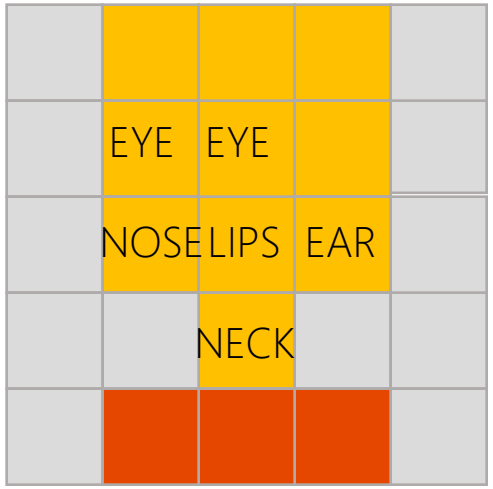
VGG Networks



Abstraction of an Image

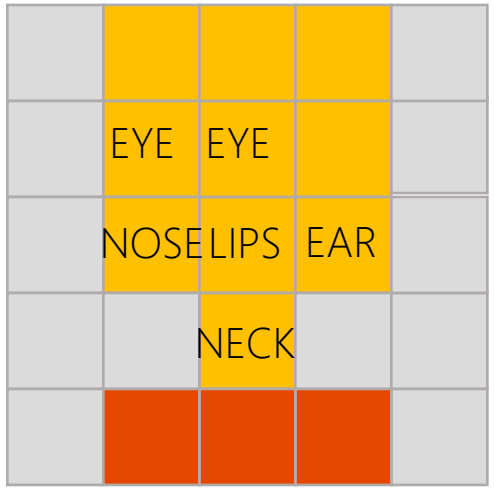


Conv2D + MaxPooling
+ Conv2D + MaxPooling
+ Conv2D + MaxPooling
+ ...



Abstraction of an Image

- Final decision is made by the fully-connected layers:



"Has two eyes, a nose, lips, an ear, and a neck and wears t-shirts"

Cat	X
Dog	X
Person	O
Orange	X

ConvNet Architectures

Right off the shelf…

ImageNet Large Scale Visual Recognition Challenge (ILSVRC)

- ImageNet (First appearance as a poster at CVPR 2009)
  - Over 14 million images with hand-annotated labels (crowdsourced via M-turk)
  - Over 20 thousand categories
  - 1M+ images with bounding boxes.

- ImageNet Challenge
  - Since 2010
  - Uses a trimmed set of thousand non-overlapping classes.
  - Humans error is about 5%*
  - Playground of computer vision researchers.
  - Marked the start of the current AI boom.

Russakovsky et al. (2015). Imagenet large scale visual recognition challenge. *International journal of computer vision*, *115*(3), 211-252.

ImageNet Large Scale Visual Recognition Challenge (ILSVRC)

- Criteria: Top-5 accuracy, Top-1 accuracy
- Say we had only four classes, namely “cat”, “dog”, “alpaca”, and “camel”. Now let’s assume that the classifier returns something like this:

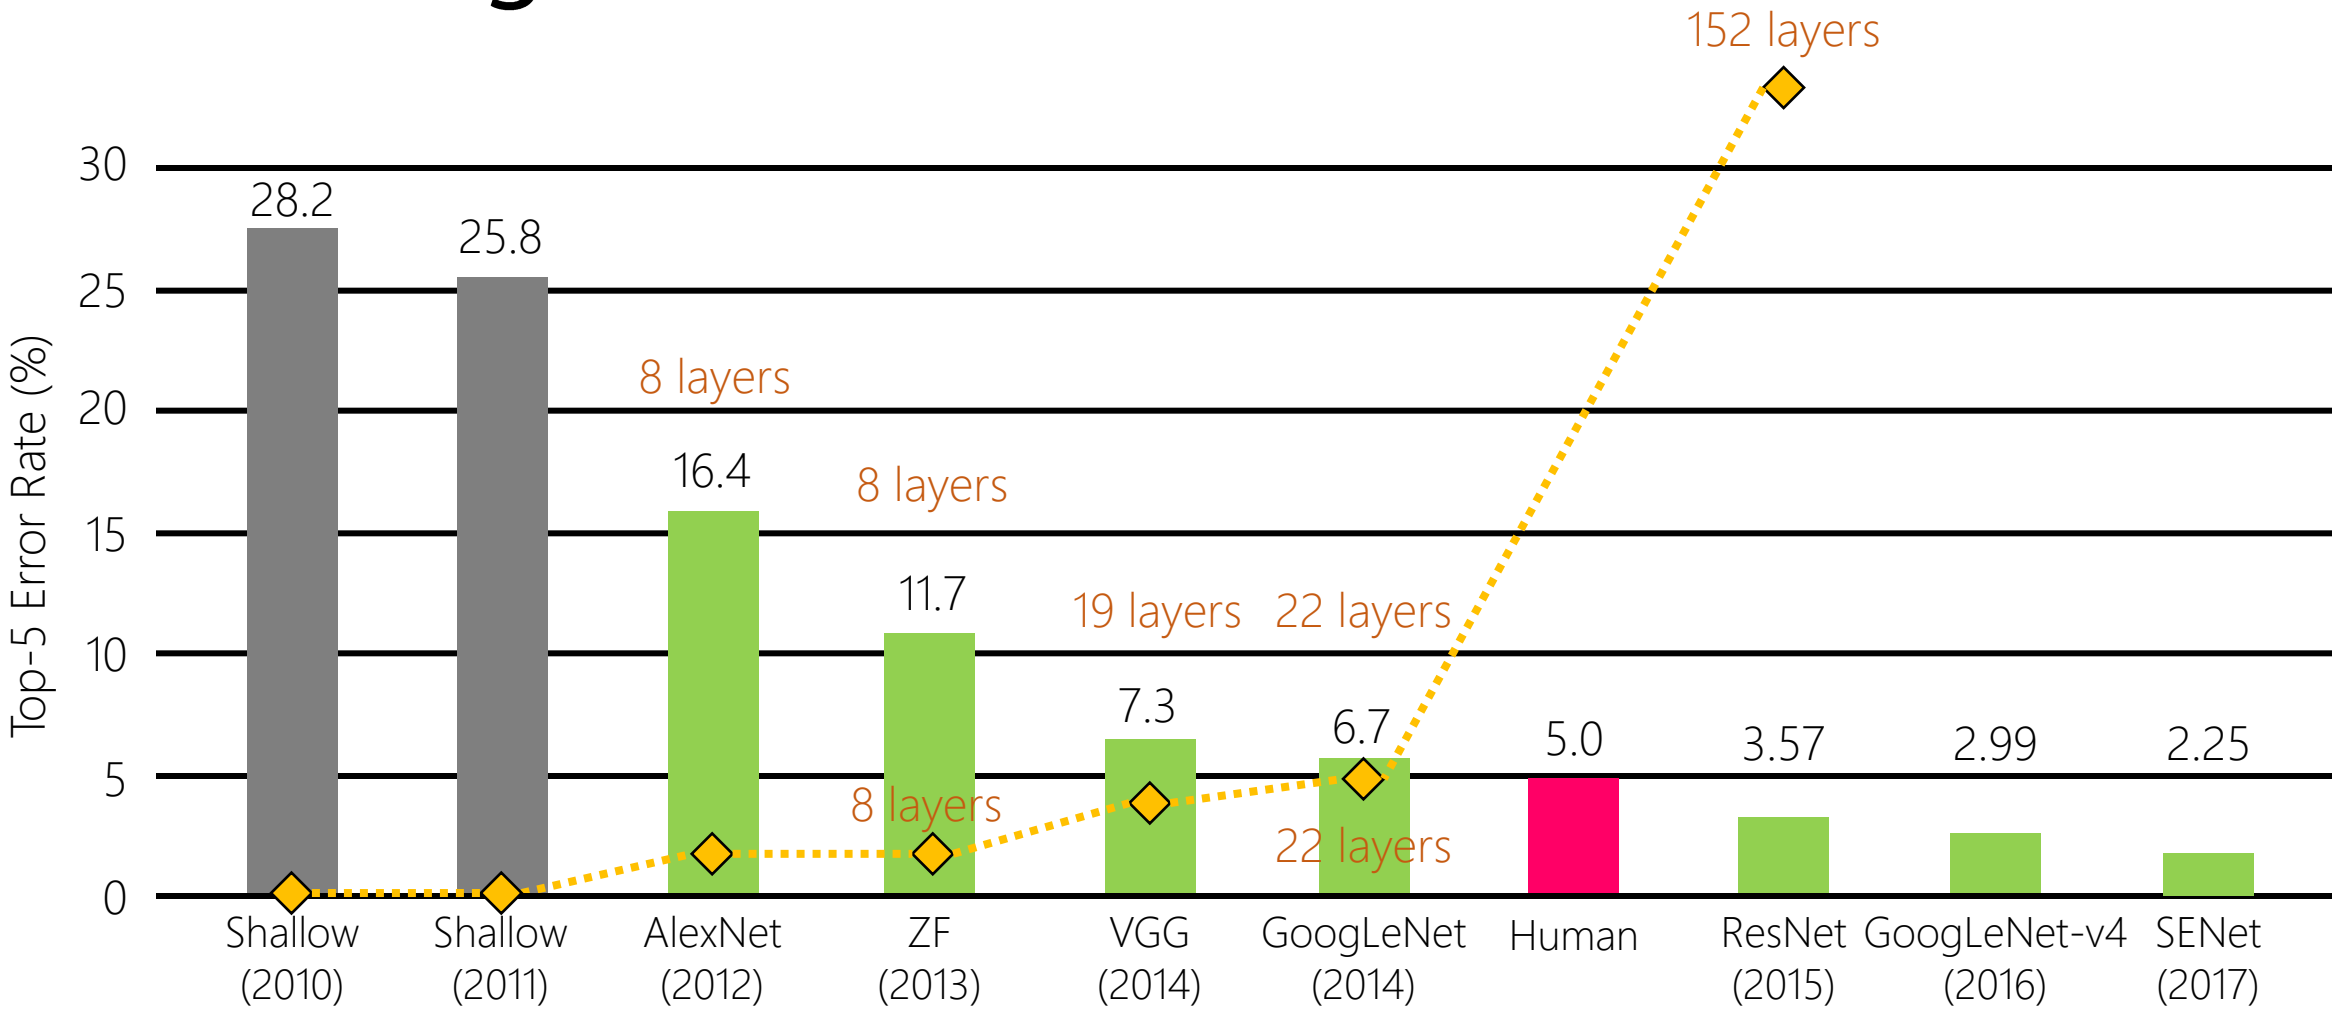
Your ML Model → [0.1, 0.5, 0.3, 0.1]

Top-1 class = {dog}
∴ Top-1 Accuracy = wrong

Top-2 class = {dog, alpaca}
∴ Top-2 Accuracy = correct

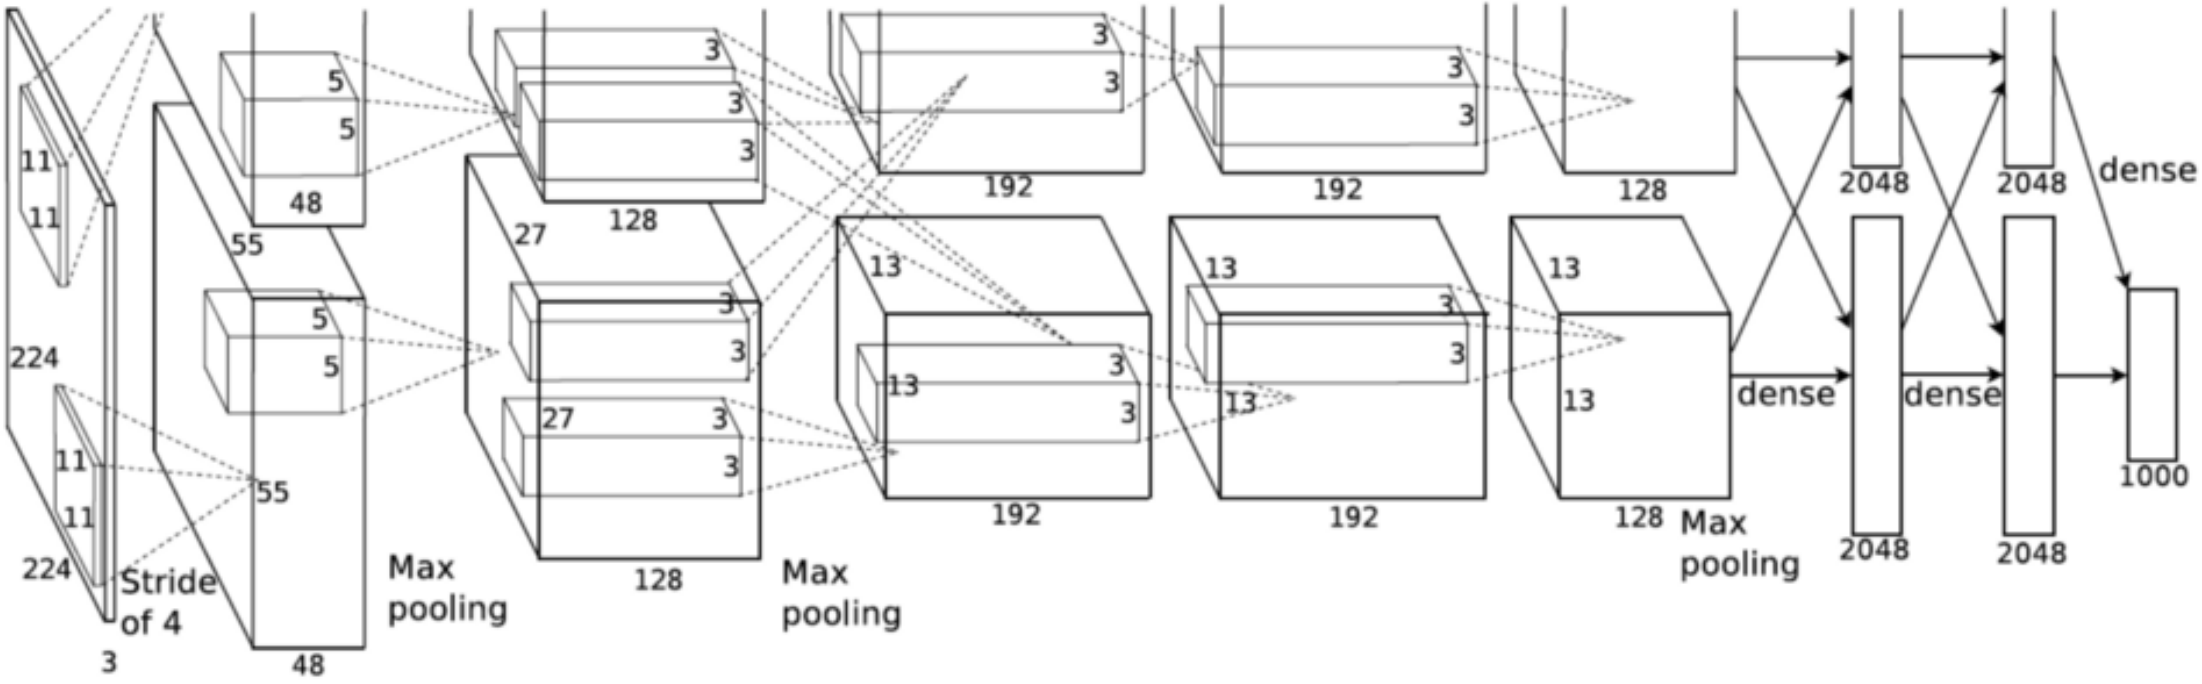
Q. Top-k accuracy for k number of classes?

ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners

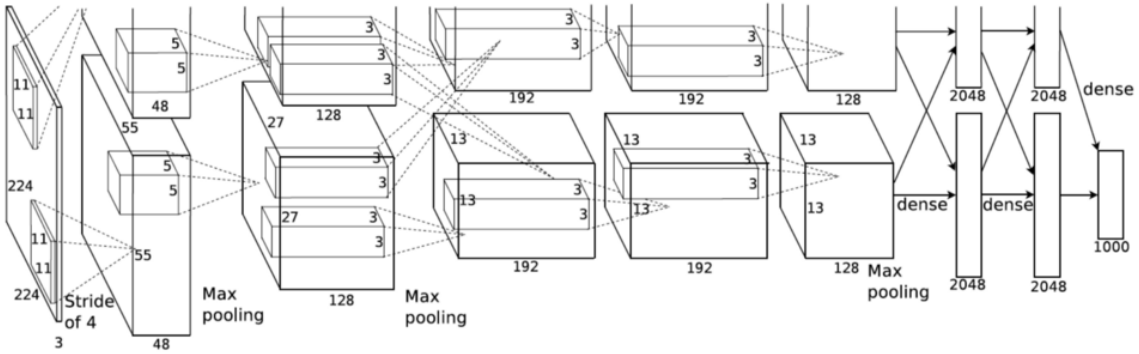


AlexNet

- Krizhevsky, Sutskever, & Hinton. (2012).



AlexNet



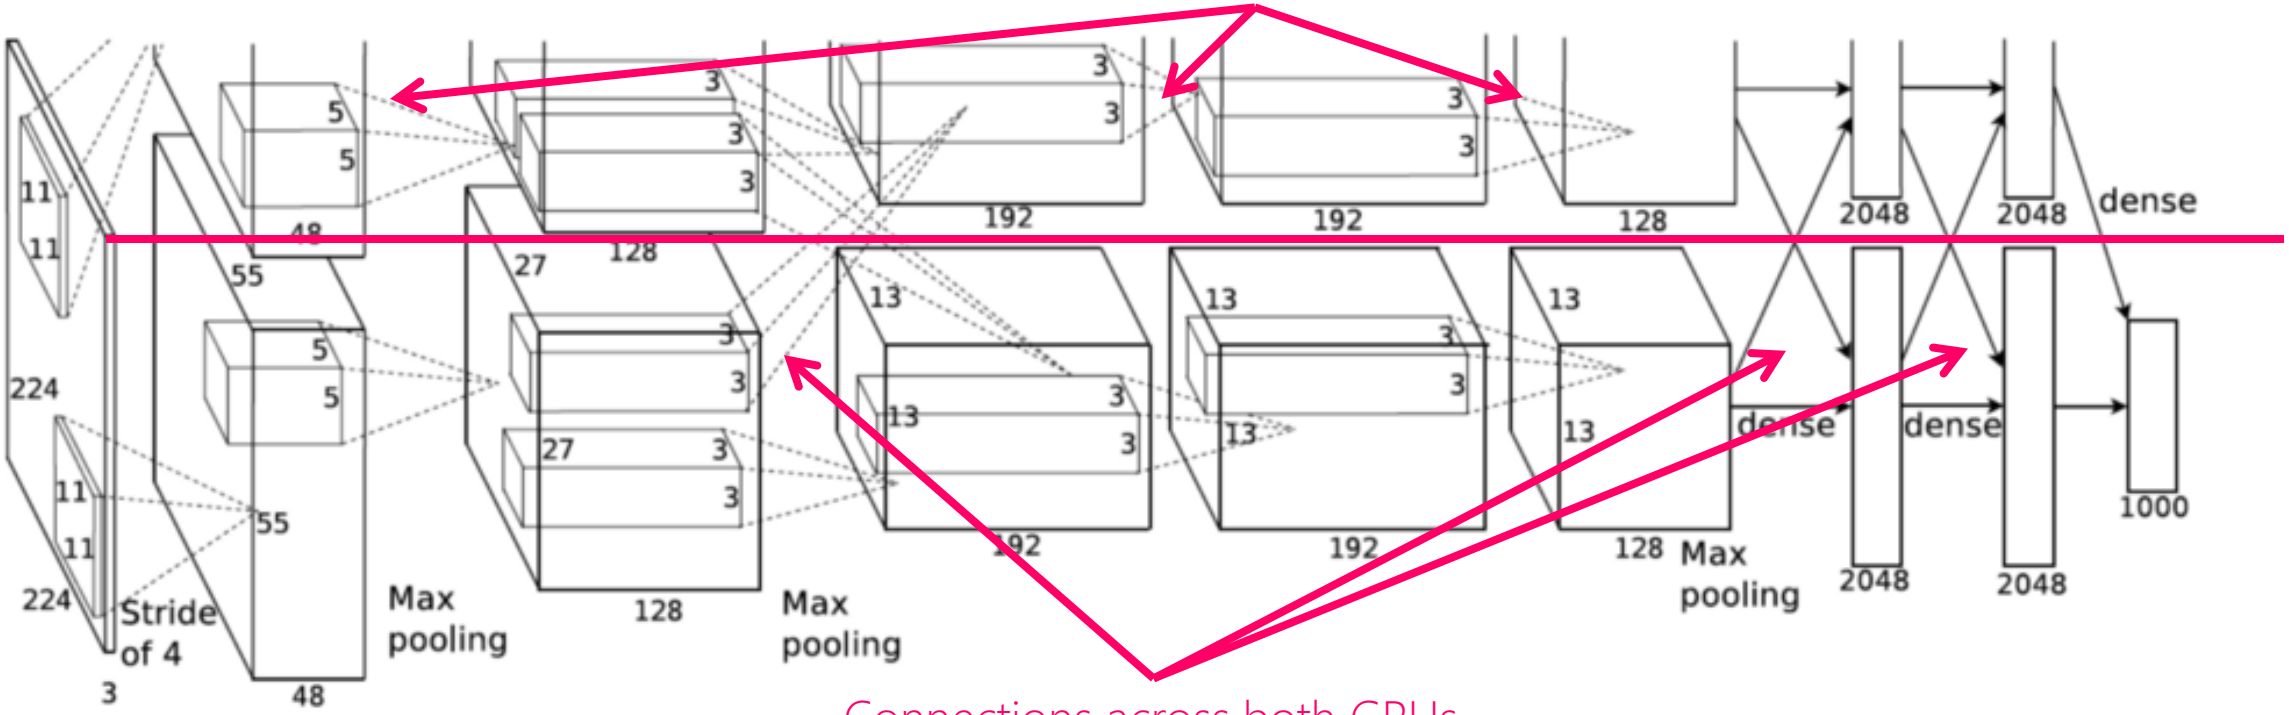
- Krizhevsky, Sutskever, & Hinton. (2012).
- 62.3M Parameters
- 1.1 billion computations in a forward pass
- Batch size 128
- SGD with Momentum 0.9
- Learning rate 0.01. The rate reduces by 10 manually when the validation accuracy plateaus
- Trained on GTX 580 GPU (3 GB memory)
  → 2x GPUs (5~6 days)
- 7 CNN ensemble (Accuracy 18.2% → 15.4%)

Conv11-96, stride 4
MaxPool3, stride 2
Norm
Conv5-256, stride 1
MaxPool3, stride 2
Norm
Conv3-384, stride 1
Conv3-384, stride 1
Conv3-256, stride 1
MaxPool3, stride 2
Dropout(0.5)
FC4096
Dropout(0.5)
FC4096
FC1000

AlexNet

- Krizhevsky, Sutskever, & Hinton. (2012).

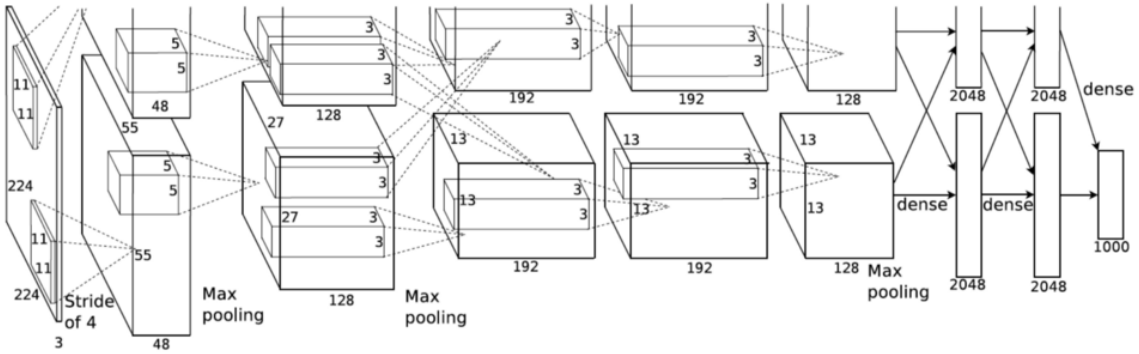
Connections only within individual GPU



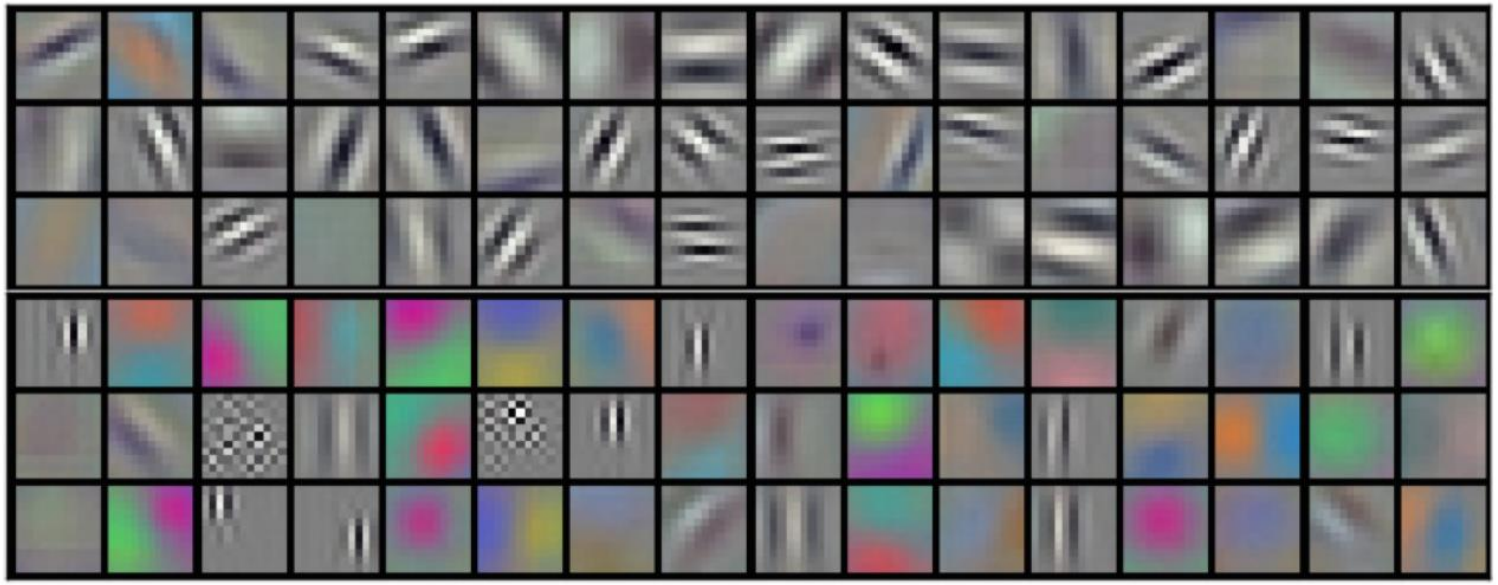
Connections across both GPUs

Dual GPU training → error rate decreases by around 1.7% (Top-1) and 1.2% (Top-5) compared with the one trained with one GPU and half neurons.

AlexNet

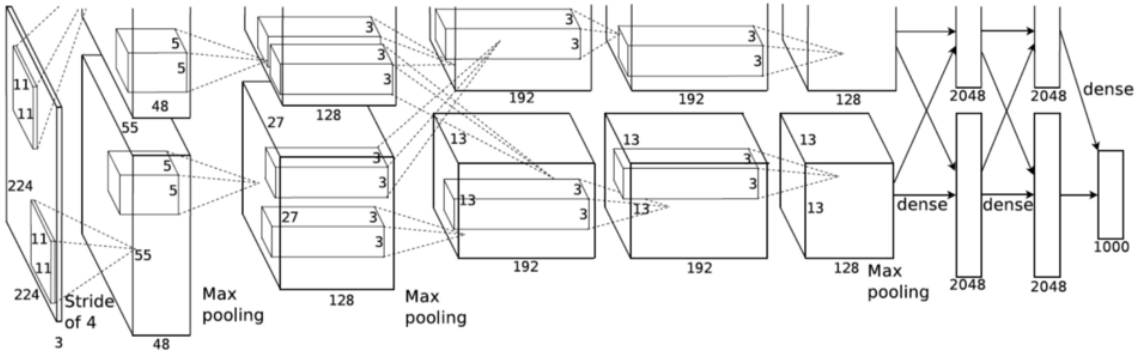


- Krizhevsky, Sutskever, & Hinton. (2012).
- 96 kernels
  - top 48 kernels on GPU 1: color-agnostic
  - Bottom 48 kernels on GPU 2: color-specific



Conv11-96, stride 4
MaxPool3, stride 2
Norm
Conv5-256, stride 1
MaxPool3, stride 2
Norm
Conv3-384, stride 1
Conv3-384, stride 1
Conv3-256, stride 1
MaxPool3, stride 2
Dropout(0.5)
FC4096
Dropout(0.5)
FC4096
FC1000

AlexNet



- Krizhevsky, Sutskever, & Hinton. (2012).

- Local Response Normalization

$$b^i_{x,y} = a^i_{x,y} / \left(k + \alpha \sum_{j=\max(0,i-n/2)}^{\min(N-1,i+n/2)} (a^j_{x,y})^2 \right)^{\beta}$$

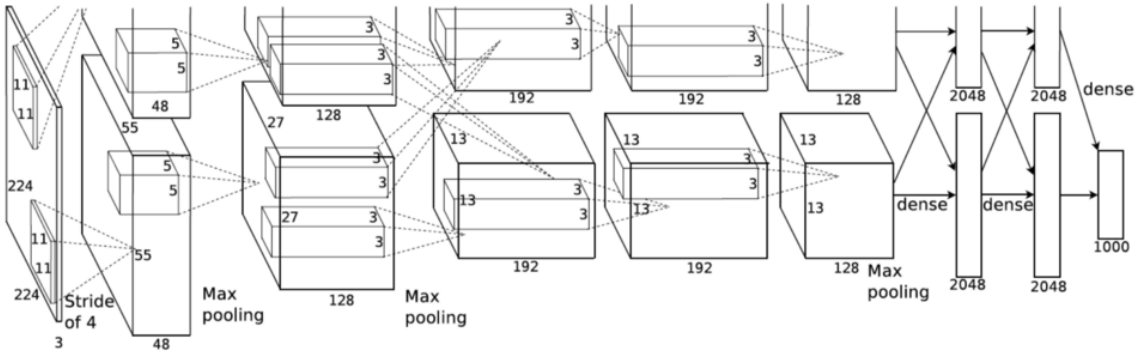
Response-normalized activity

Activity of a neuron computed by applying kernel I at position (x,y) and then applying the ReLU nonlinearity

Response normalization reduces error rates by 1.4% (Top-1) & 1.2% (Top-5)

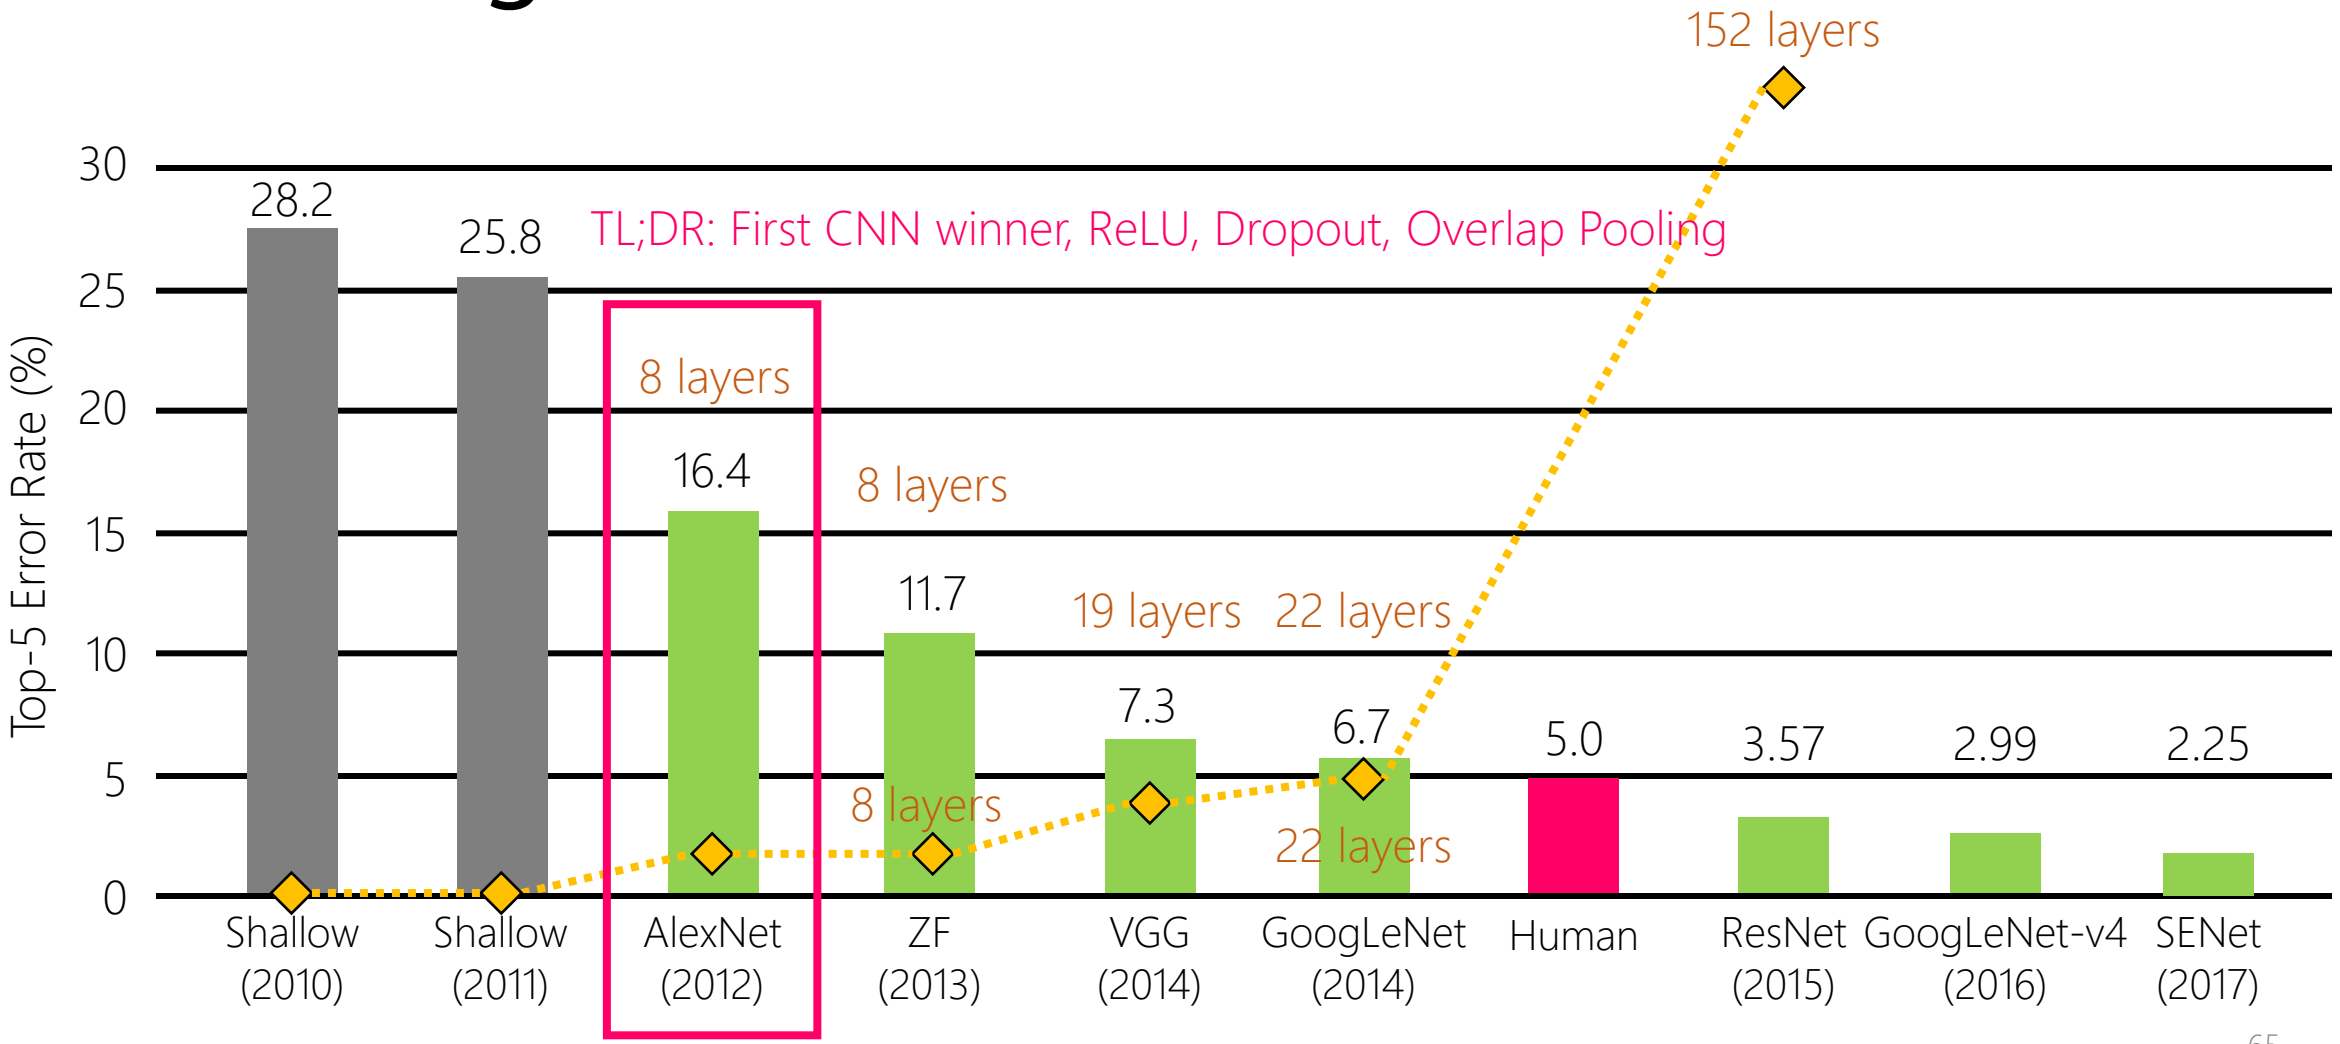
Conv11-96, stride 4
MaxPool3, stride 2
Norm
Conv5-256, stride 1
MaxPool3, stride 2
Norm
Conv3-384, stride 1
Conv3-384, stride 1
Conv3-256, stride 1
MaxPool3, stride 2
Dropout(0.5)
FC4096
Dropout(0.5)
FC4096
FC1000

AlexNet

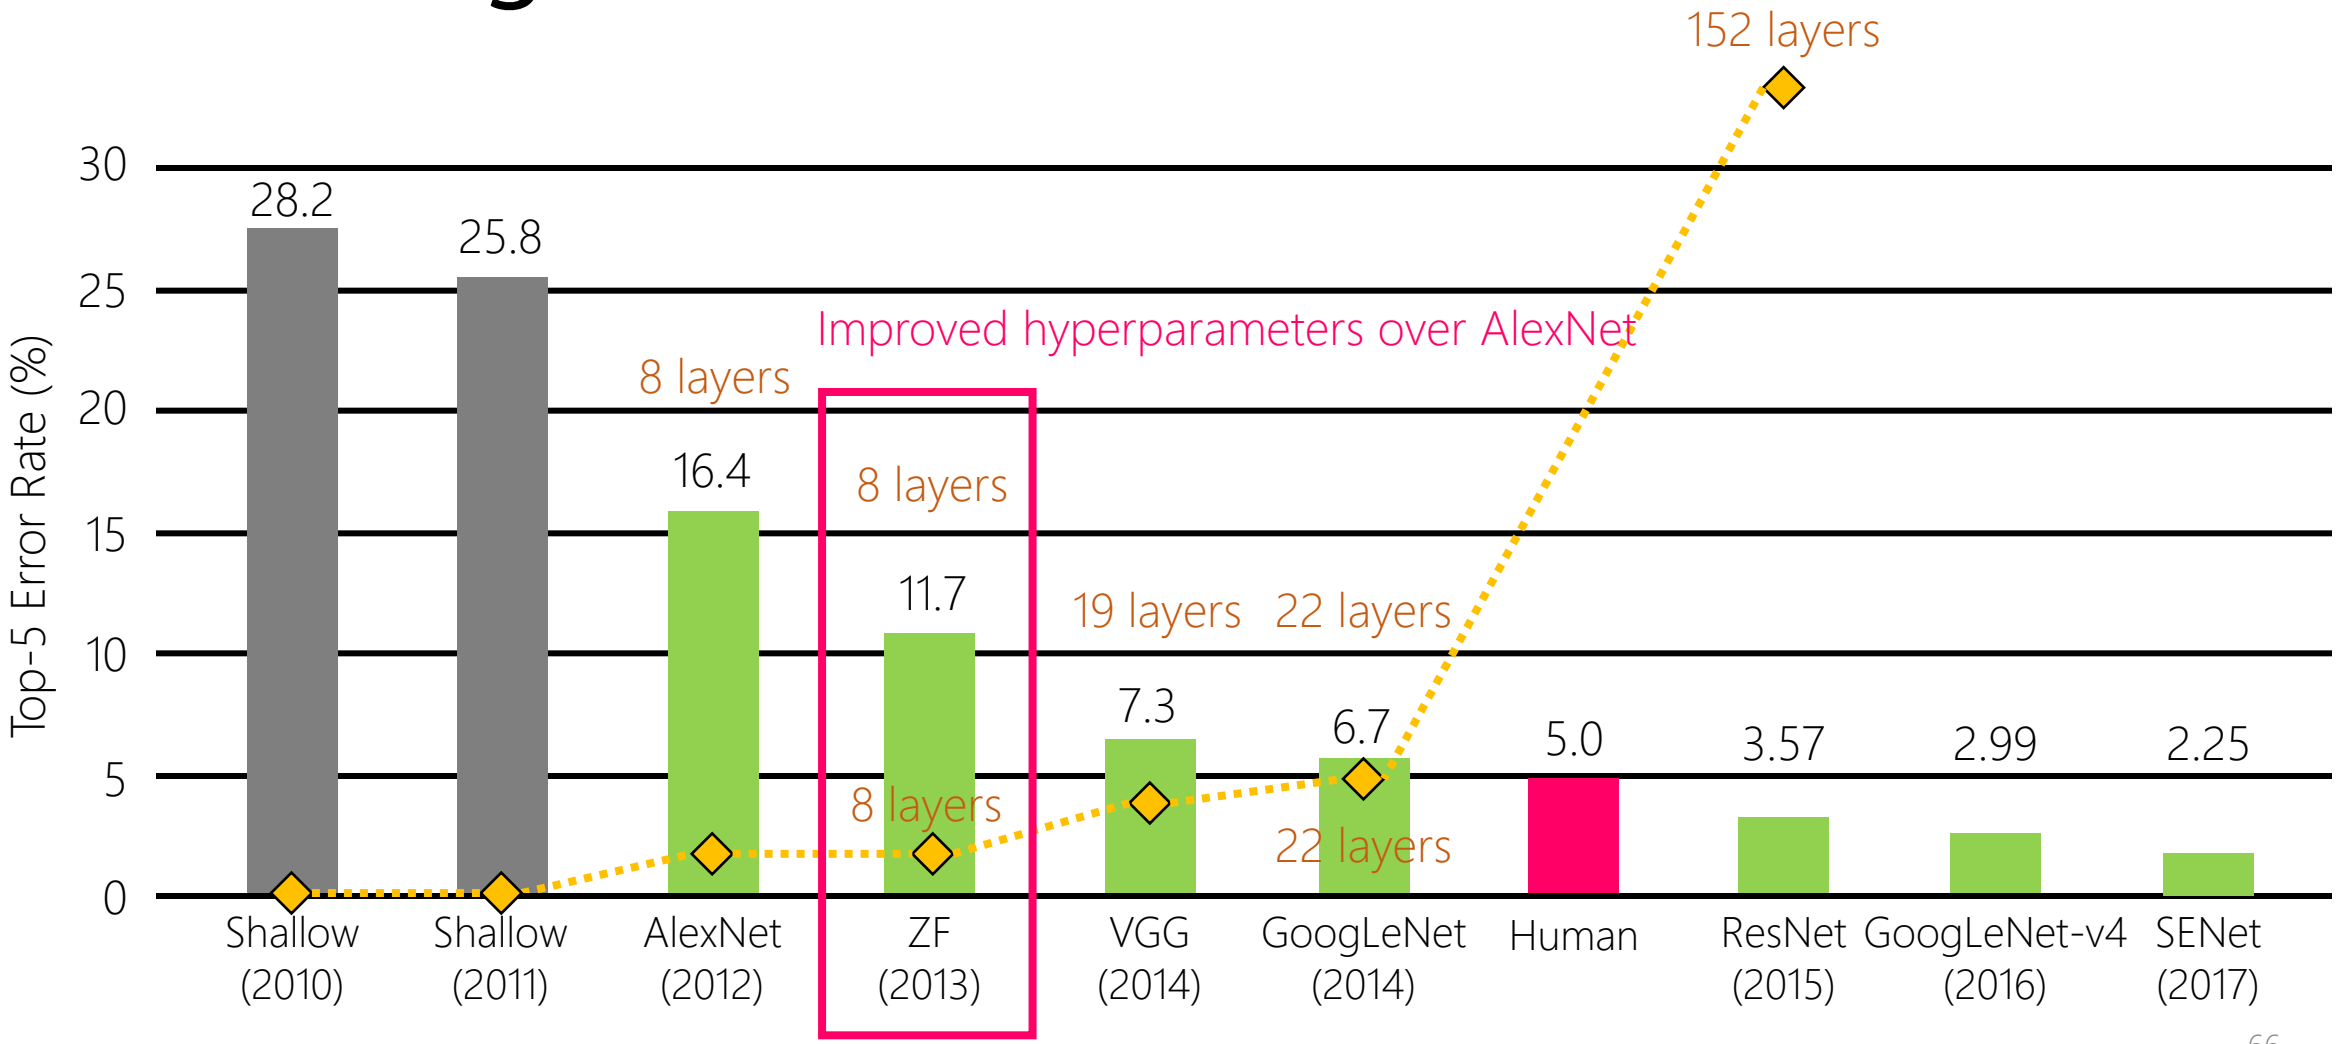


- Krizhevsky, Sutskever, & Hinton. (2012).
- Famously won the LSVRC 2012 by a large margin. (First CNN-based winner)
- First use of ReLU, instead of tanh or sigmoid.
- Dropout has been used to deal with overfitting.
- Data augmentation
- Overlap pooling → error rate decreases around 0.4% (Top-1) & 0.3% (Top-5)
- Used Norm layers (different from batch norm) → not popular anymore (turned out not very useful)

ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners

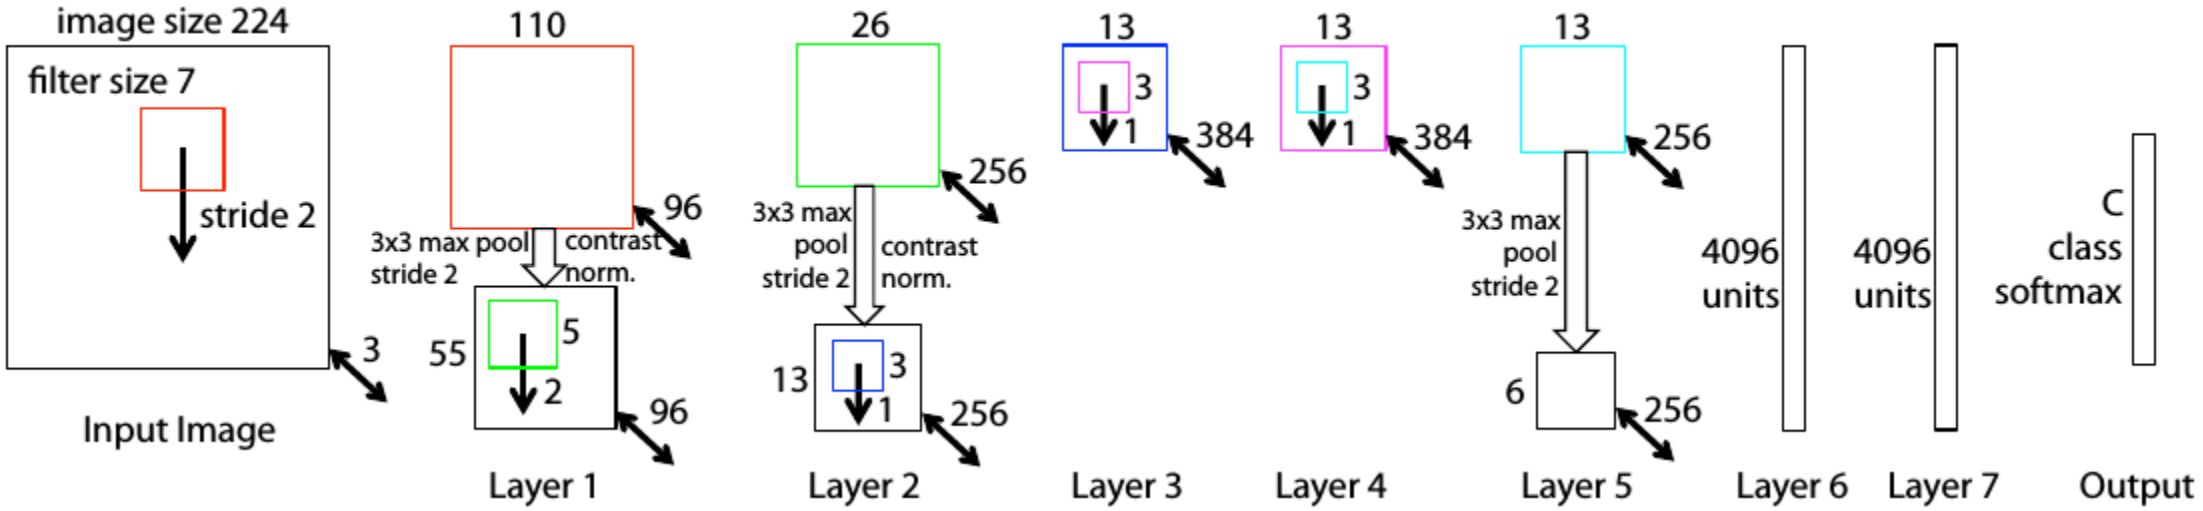


ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners

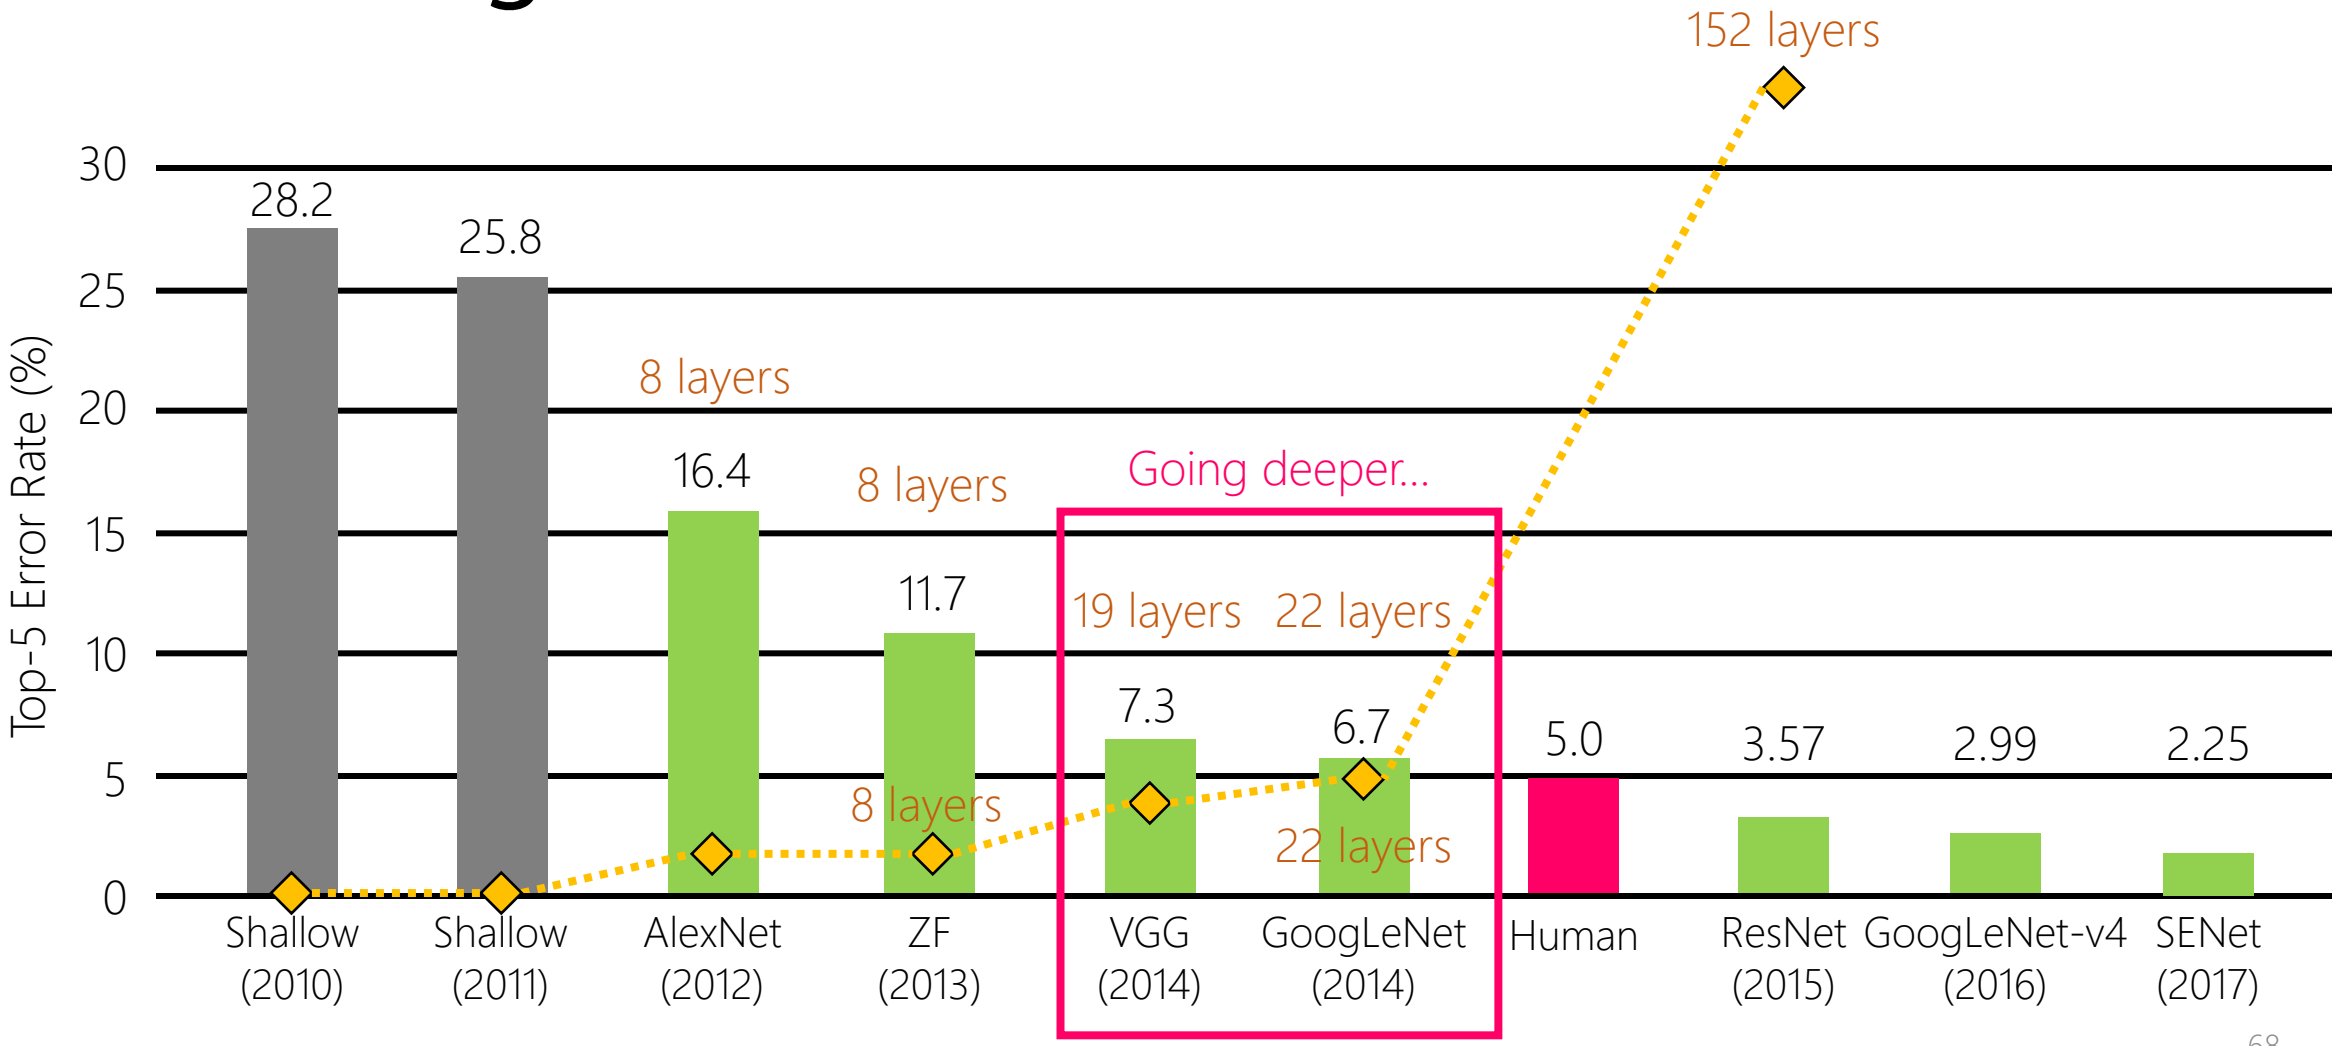


ZFNet

- Zeiler & Fergus (2013)
- Basically AlexNet, but
  - The first conv layer is changed from (11x11 stride 4) to (7x7 stride 2)
  - The third~fifth conv layer: instead of 384, 384, 256 kernels, ZFNet uses 512, 1024, 512 kernels.

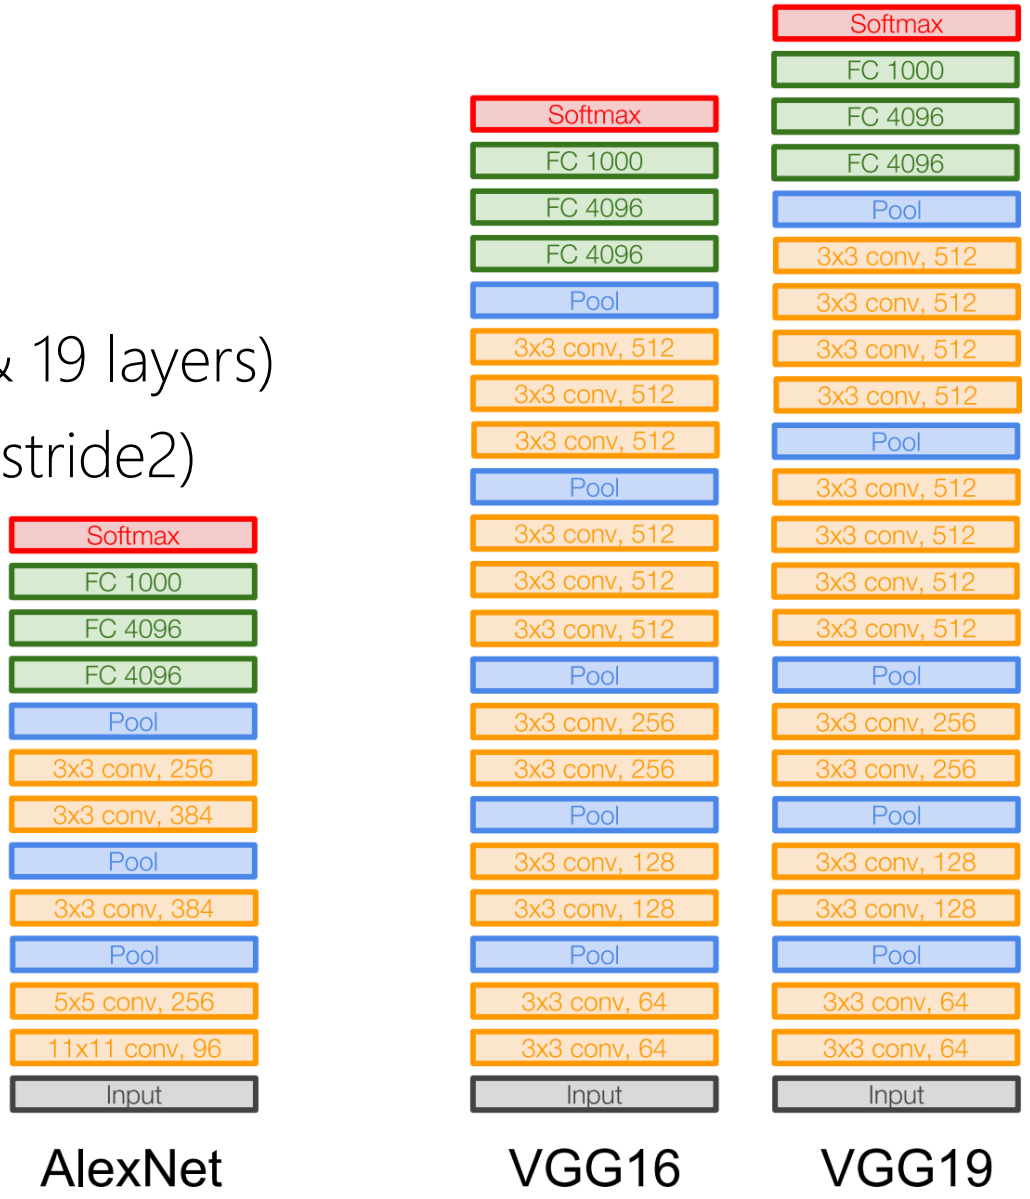


ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners



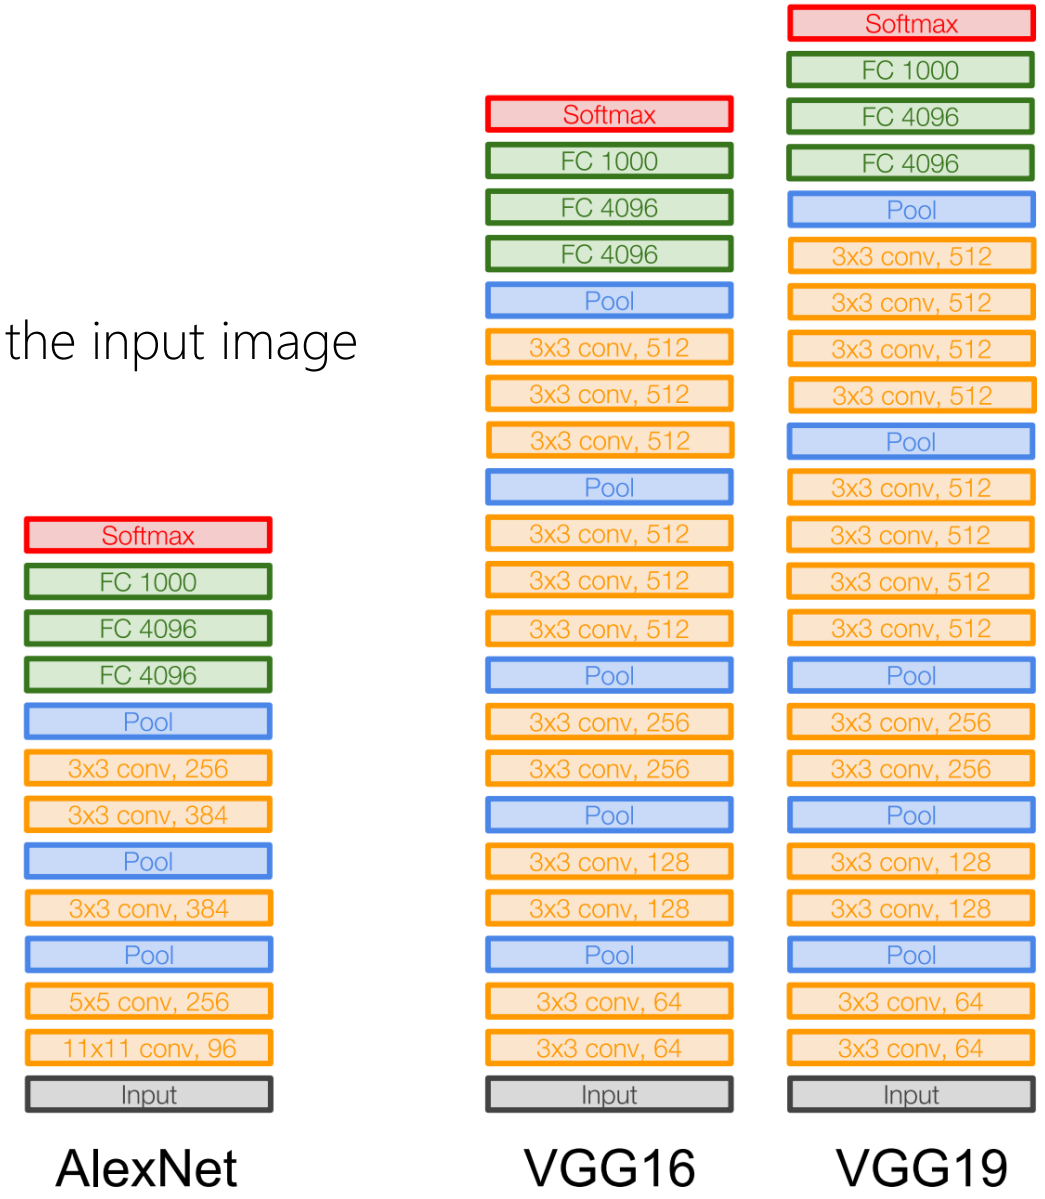
VGGNet

- Go deeper with smaller filters!
- AlexNet (8 layers) → VGG16 & VGG19 (16 & 19 layers)
- Only (Conv3-stride1-pad1) and (MaxPool2-stride2)
- First time went below 10% error.



VGGNet

- Why use small filters?
  - Stack of three Conv3 layers covers 7x7 area in the input image (receptive field)
  - Same RF, but deeper, more nonlinearity
  - Obviously, fewer parameters! (7*7 vs 3*3*3)



VGGNet

(not counting biases)

INPUT: [224x224x3] memory: 224*224*3=150K params: 0

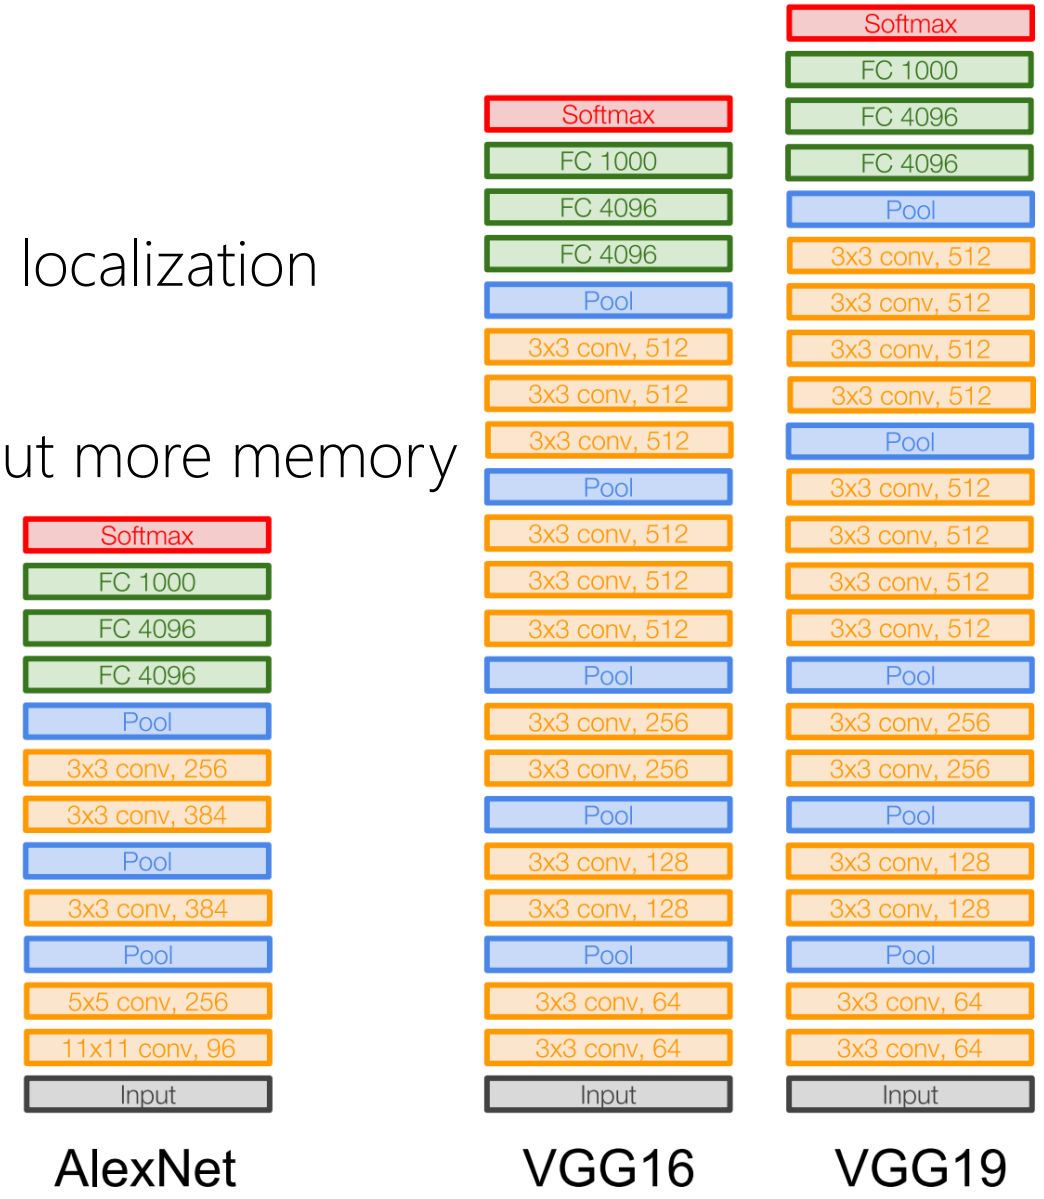
TOTAL memory: 24M * 4 bytes ~= 96MB / image (only forward! ~*2 for bwd)
TOTAL params: 138M parameters

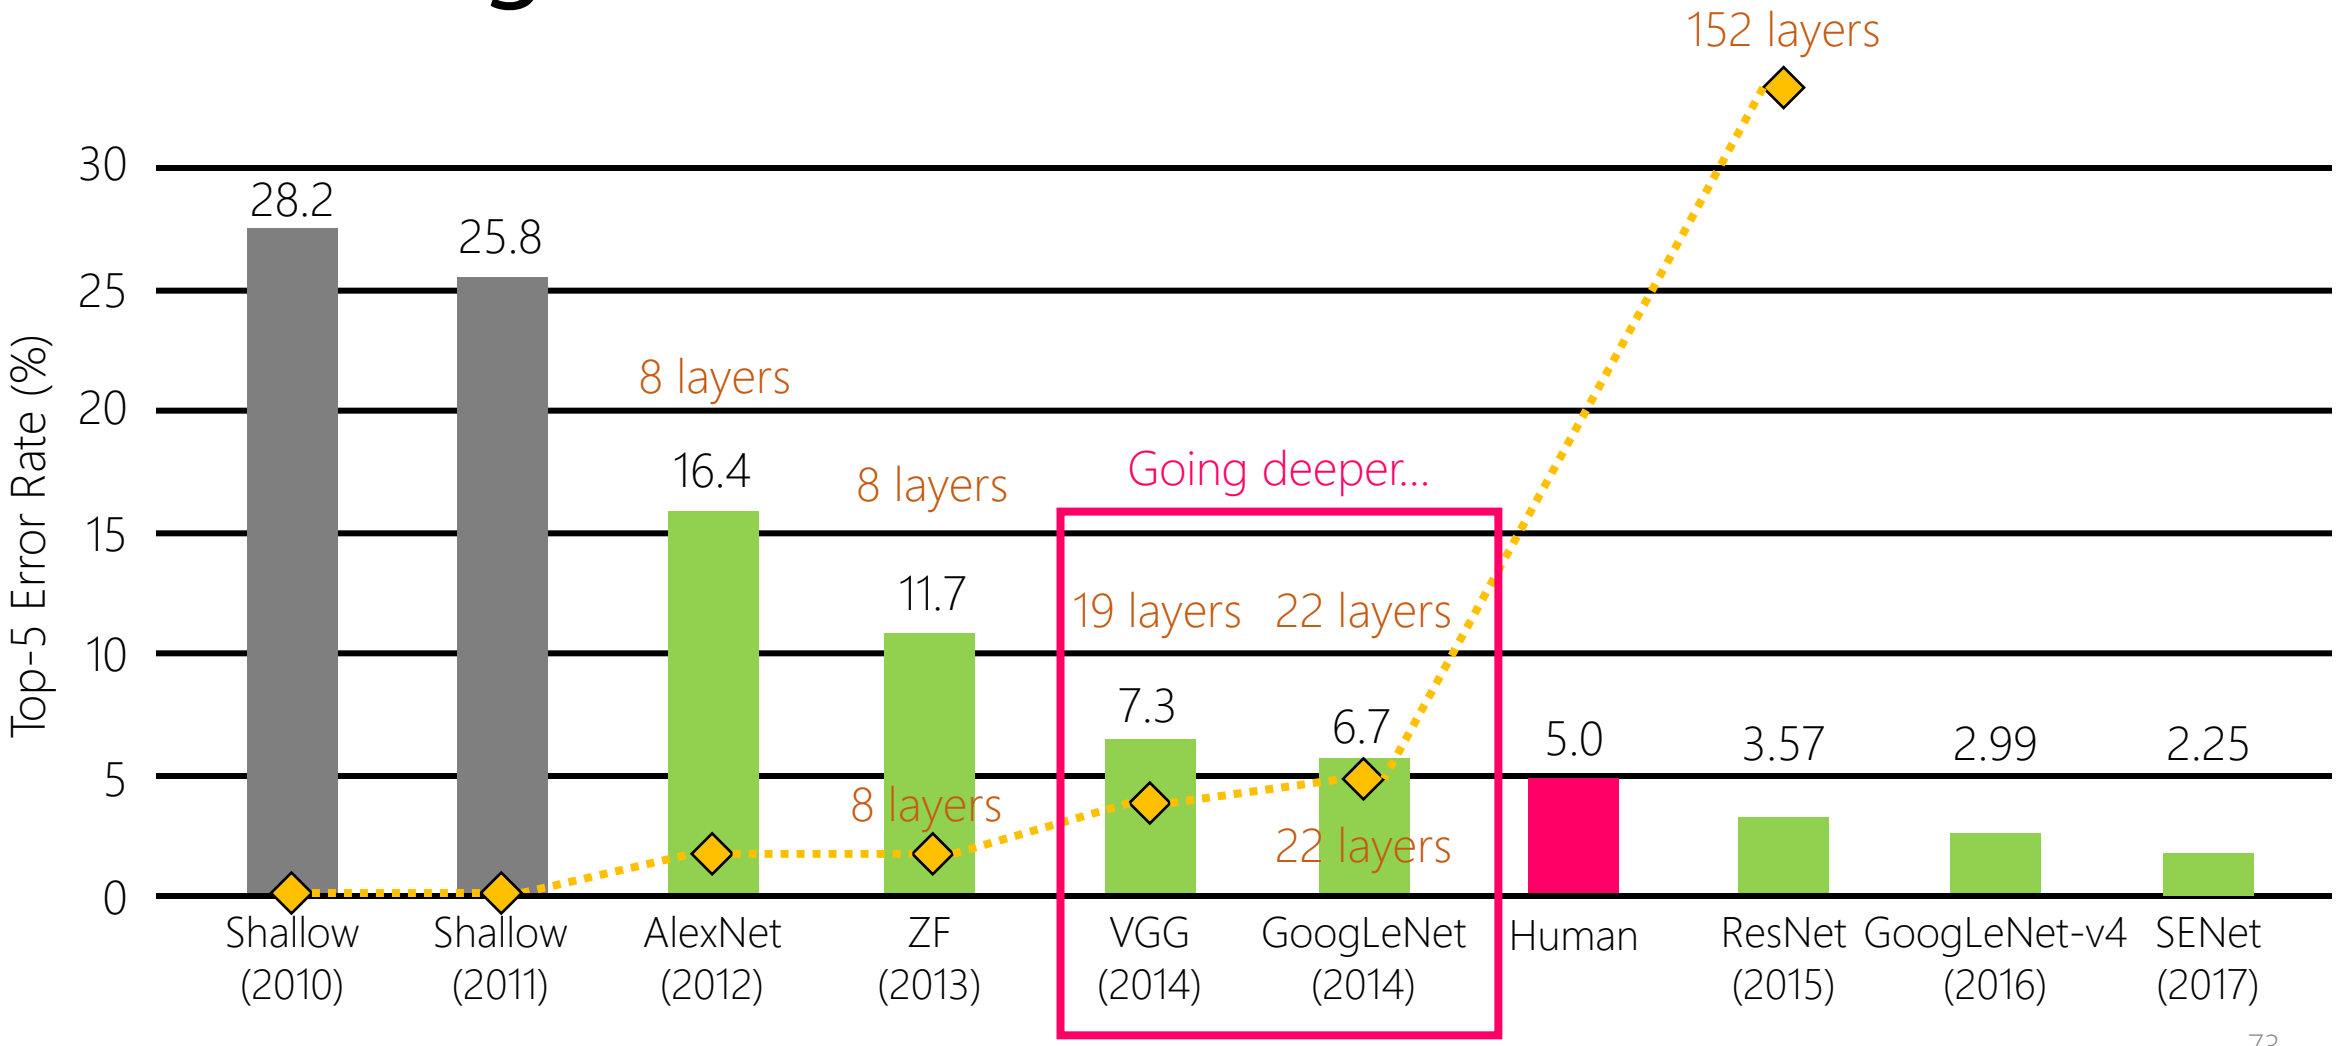
VGG16

VGGNet

- ILSVRC'14 runner-up in classification, 1st in localization
- No local response normalization
- VGG19 is only slightly better than VGG16 but more memory
- Simple and straightforward, the second FC layer generalizes quite well when transferred → "garlic salt"

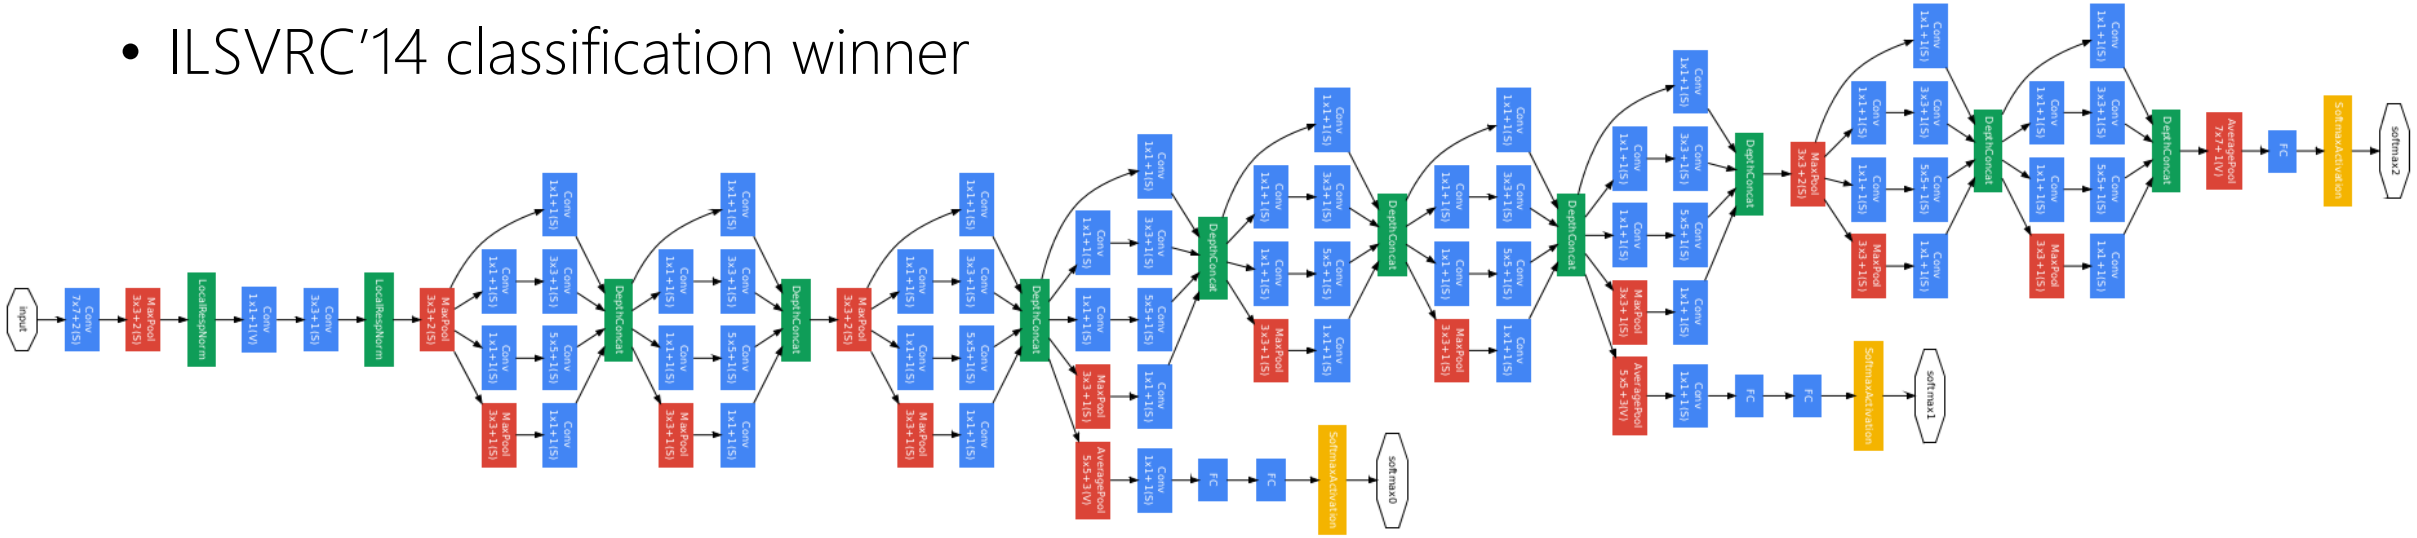


ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners



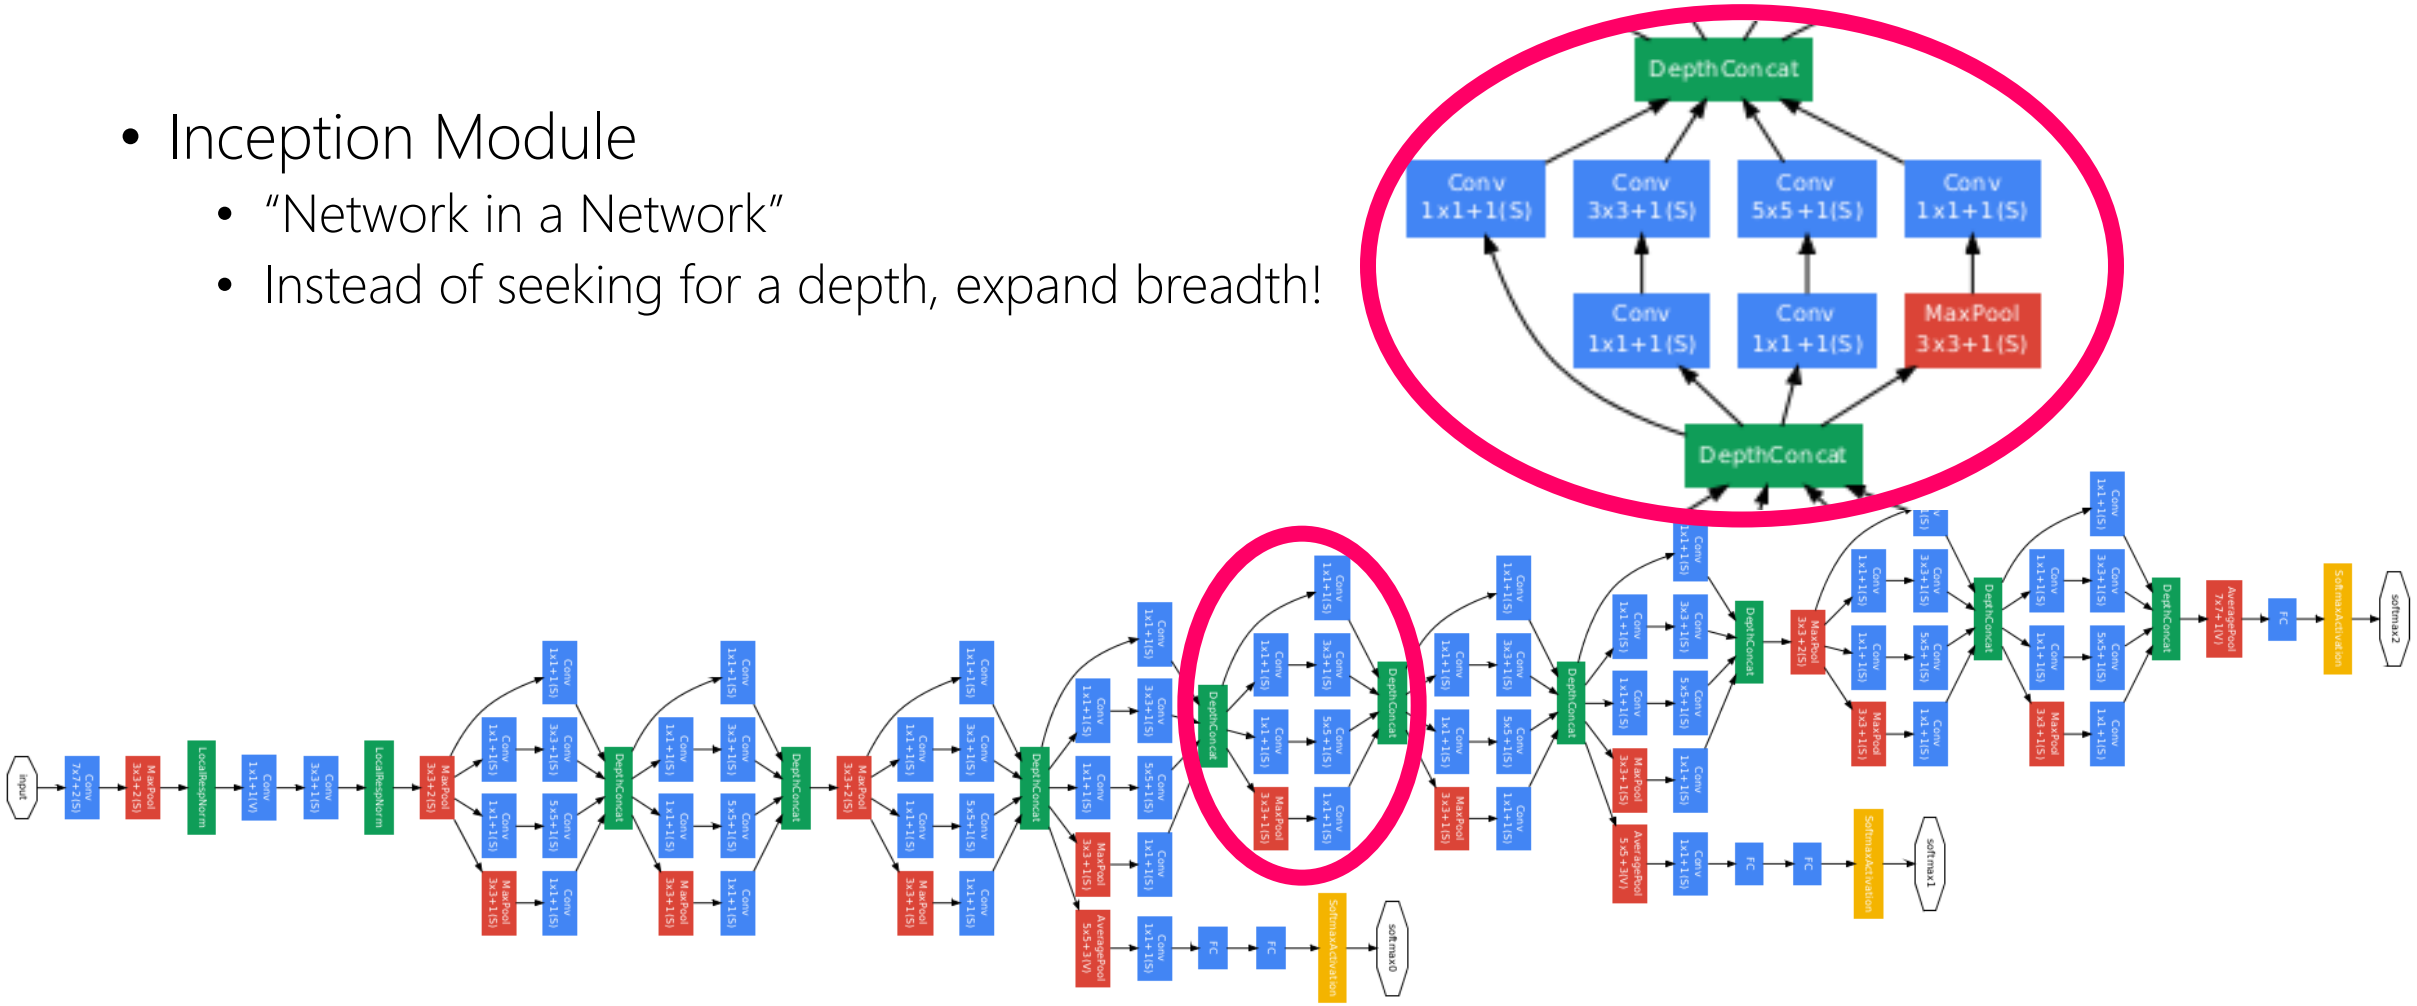
GoogLeNet a.k.a. Inception Network

- Deeper but efficient computation!
- Efficiency via inception module
- Reduced FC layers
- Only 5M, as opposed to 62M (AlexNet) & 138M (VGG16)
- ILSVRC'14 classification winner



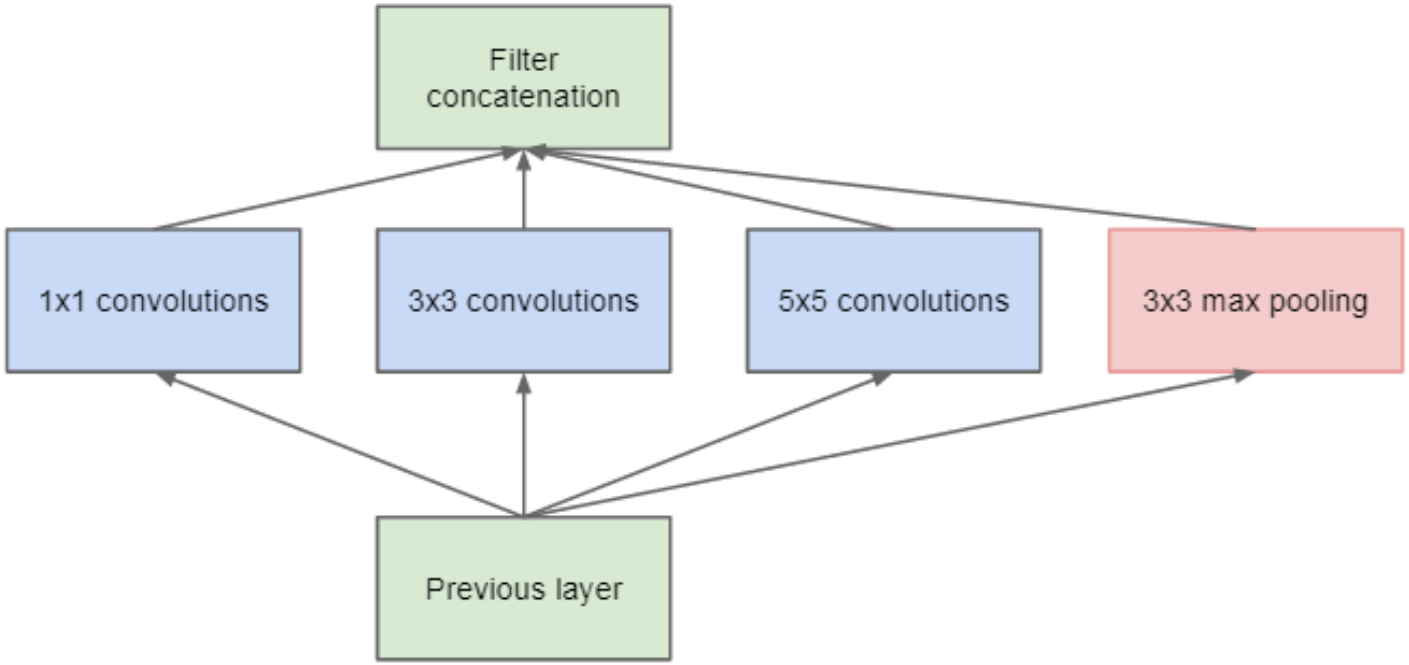
GoogLeNet a.k.a. Inception Network

- Inception Module
  - "Network in a Network"
  - Instead of seeking for a depth, expand breadth!



GoogLeNet a.k.a. Inception Network

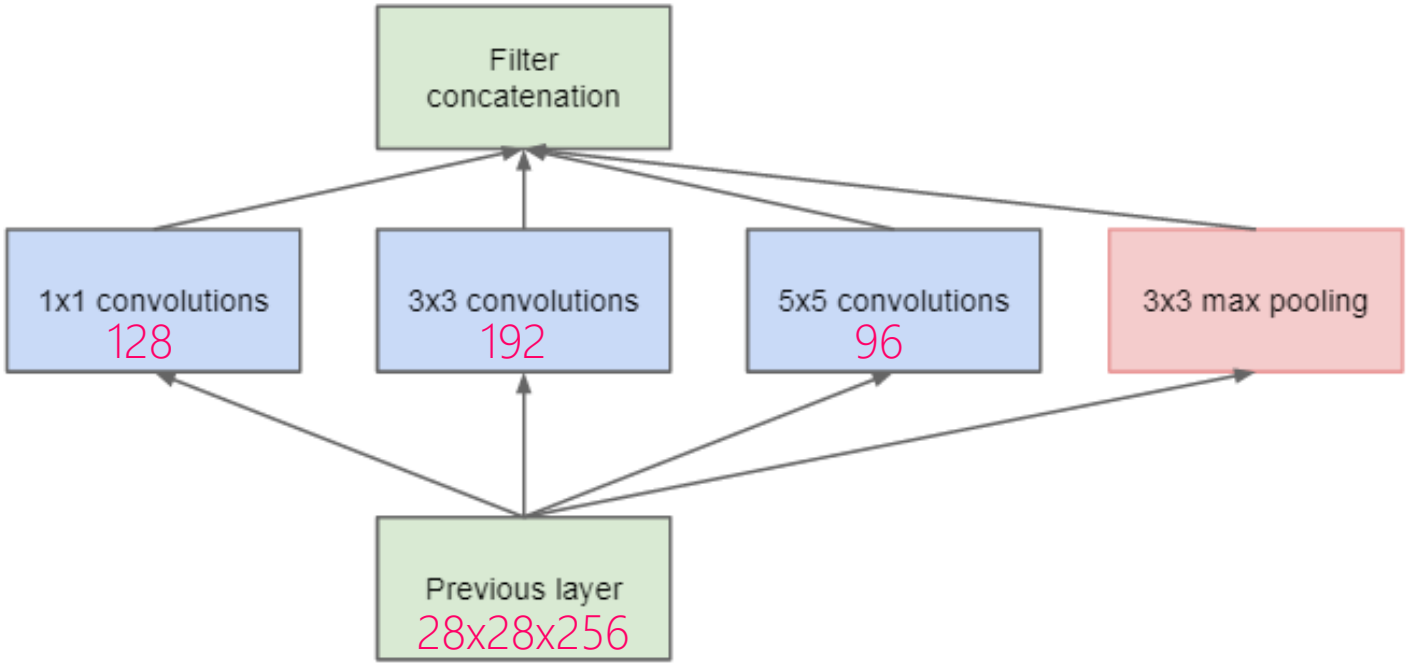
- Naïve Inception Module
  - "Why bother to decide which size of convolution to use when you can have them all?"



(a) Inception module, naïve version

GoogLeNet a.k.a. Inception Network

- Naïve Inception Module
  - "Why bother to decide which size of convolution to use when you can have them all?"

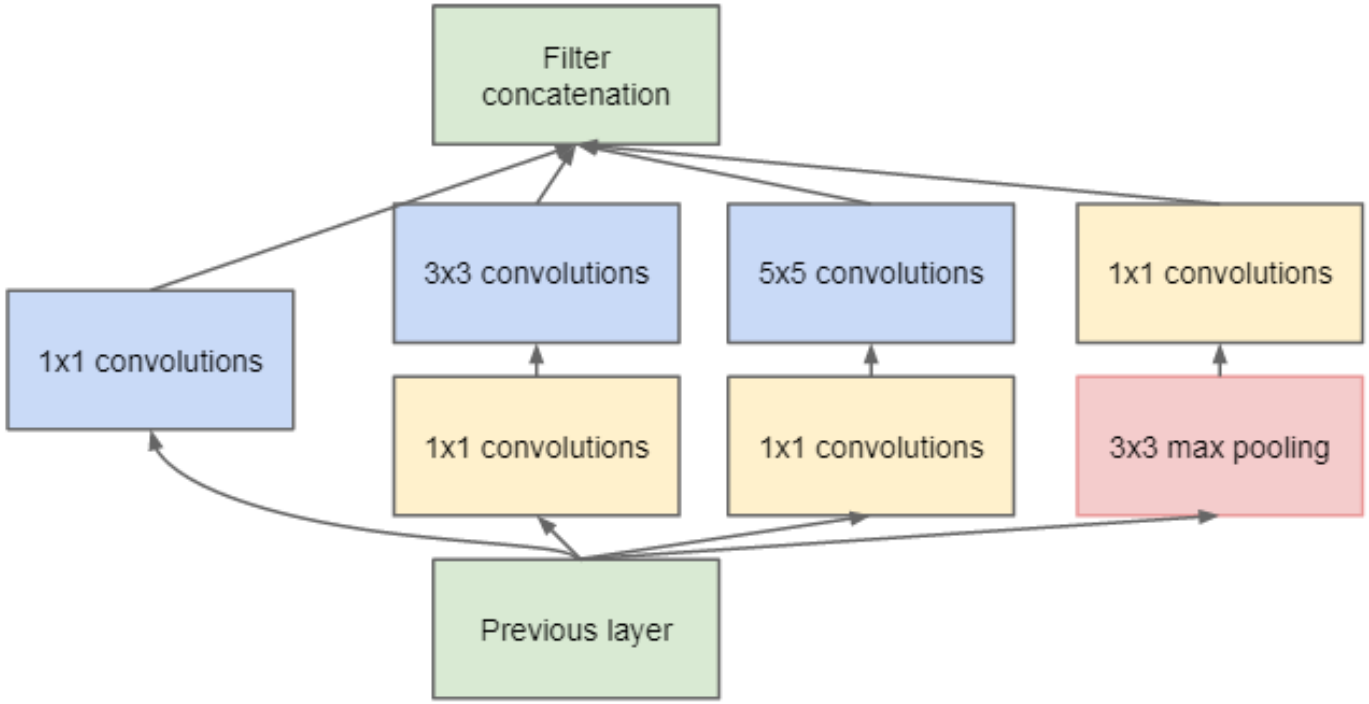


(a) Inception module, naïve version

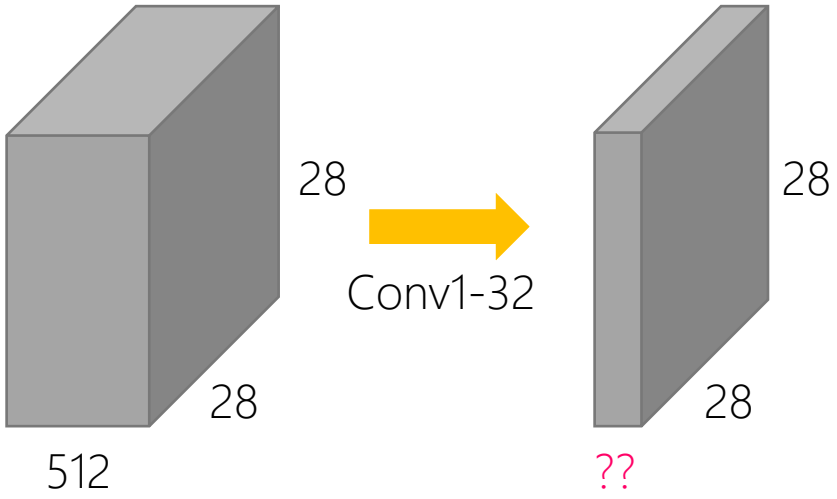
Q. What's wrong with the naïve version?

GoogLeNet a.k.a. Inception Network

- Inception module with bottleneck layers

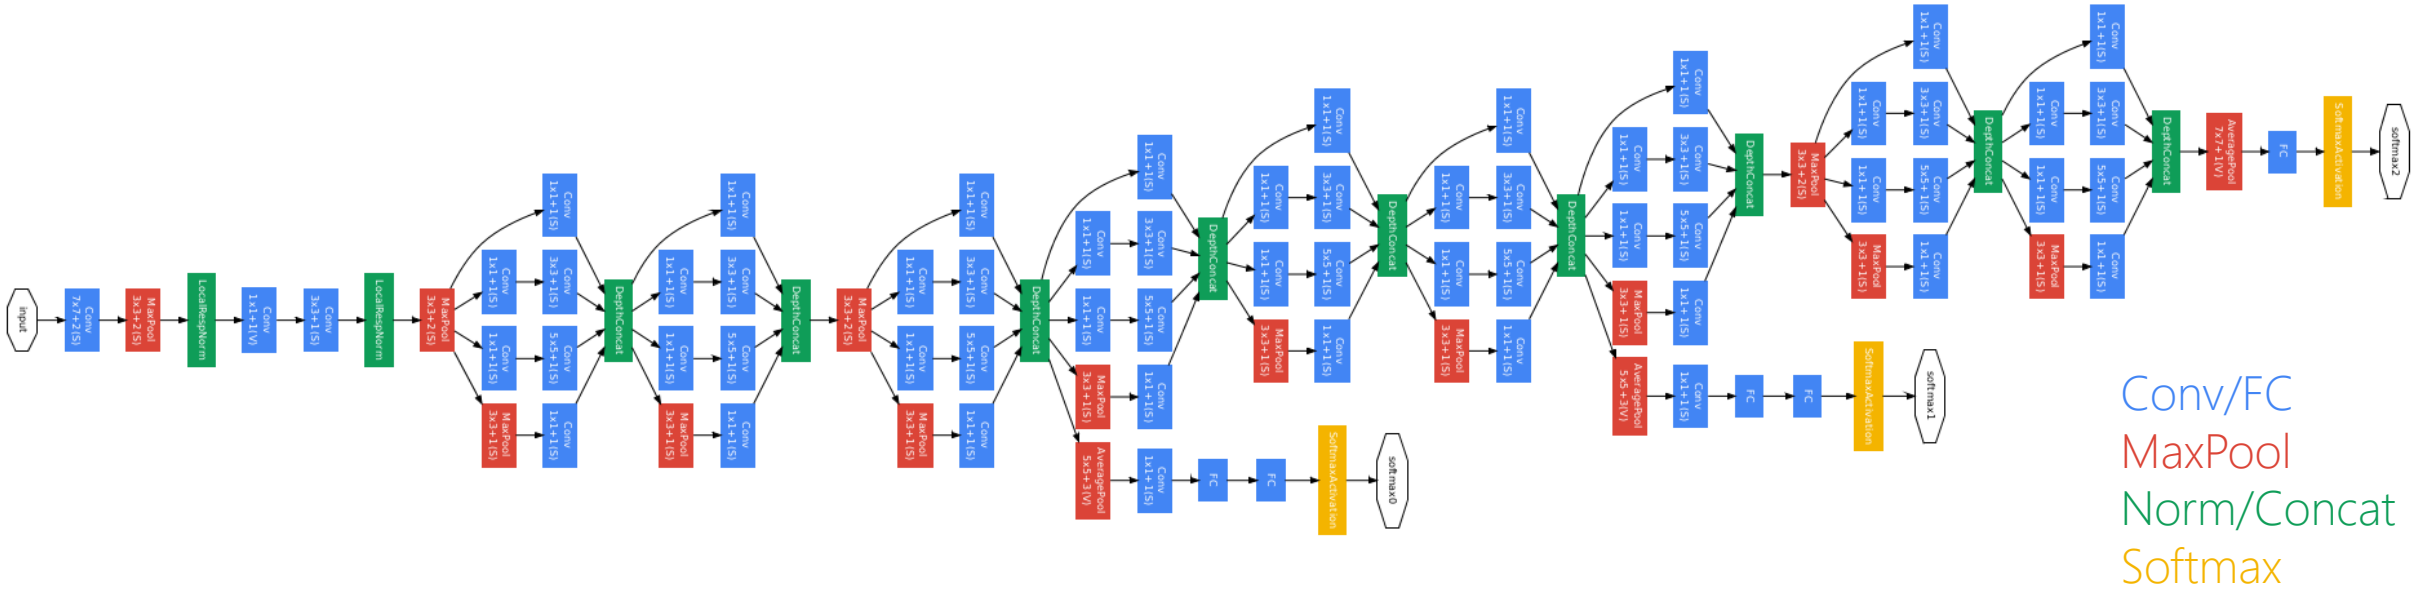


(b) Inception module with dimension reductions



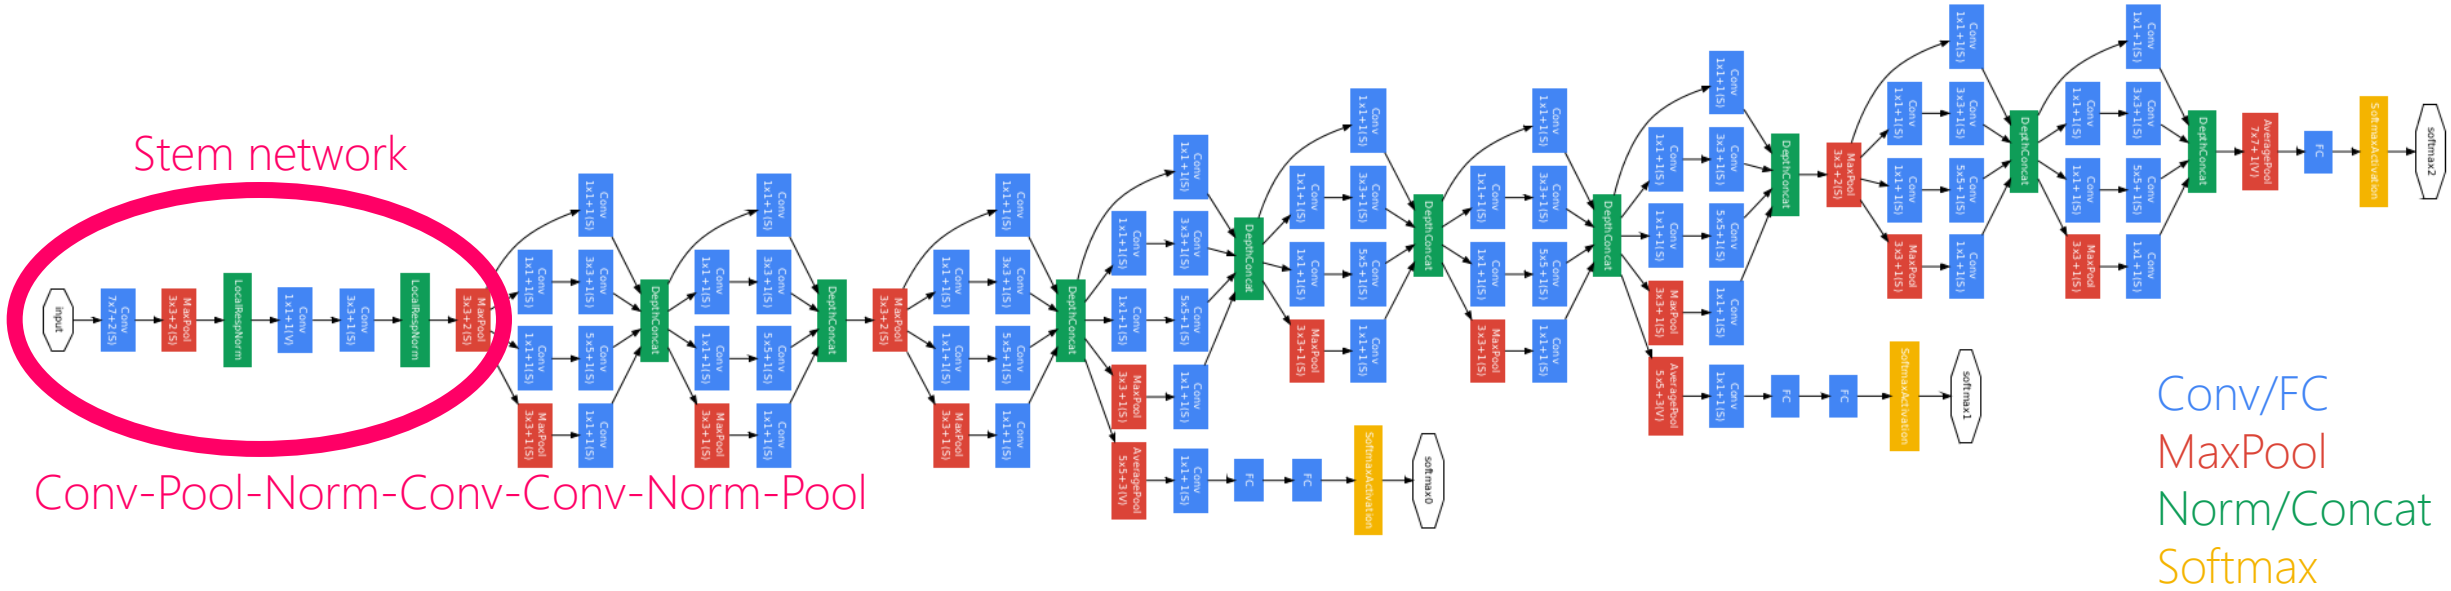
GoogLeNet a.k.a. Inception Network

- Putting them all together…



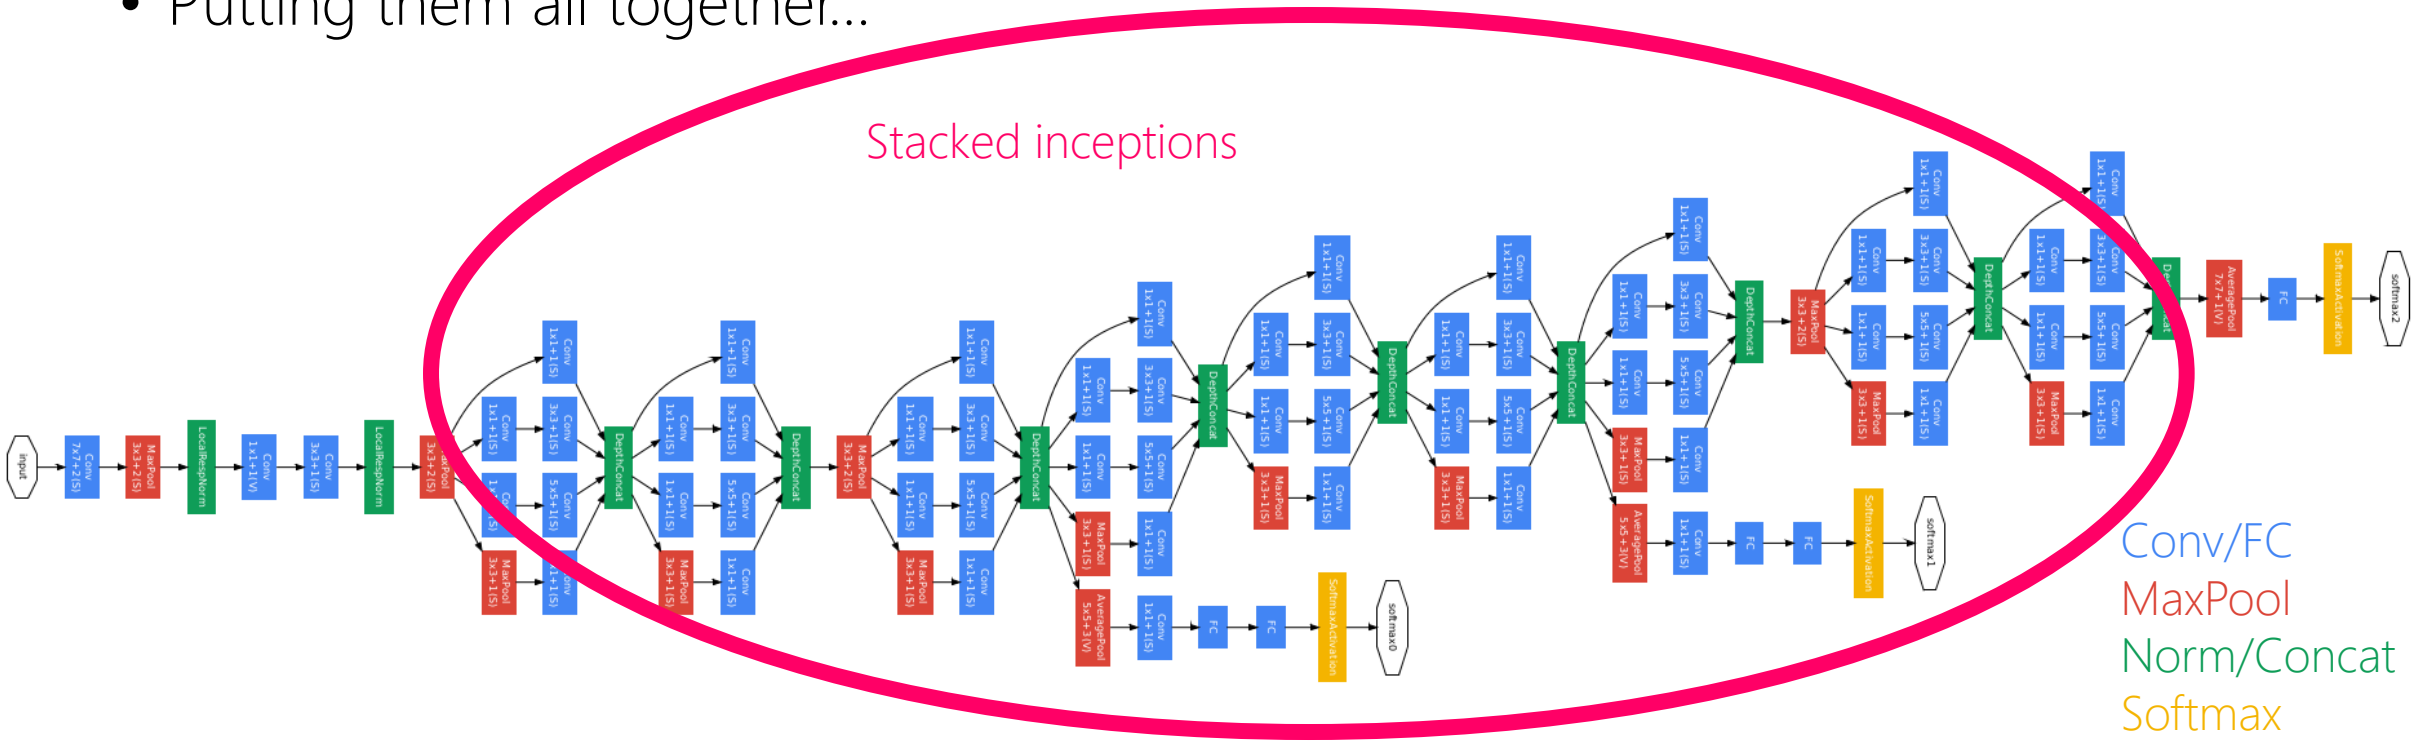
GoogLeNet a.k.a. Inception Network

- Putting them all together…



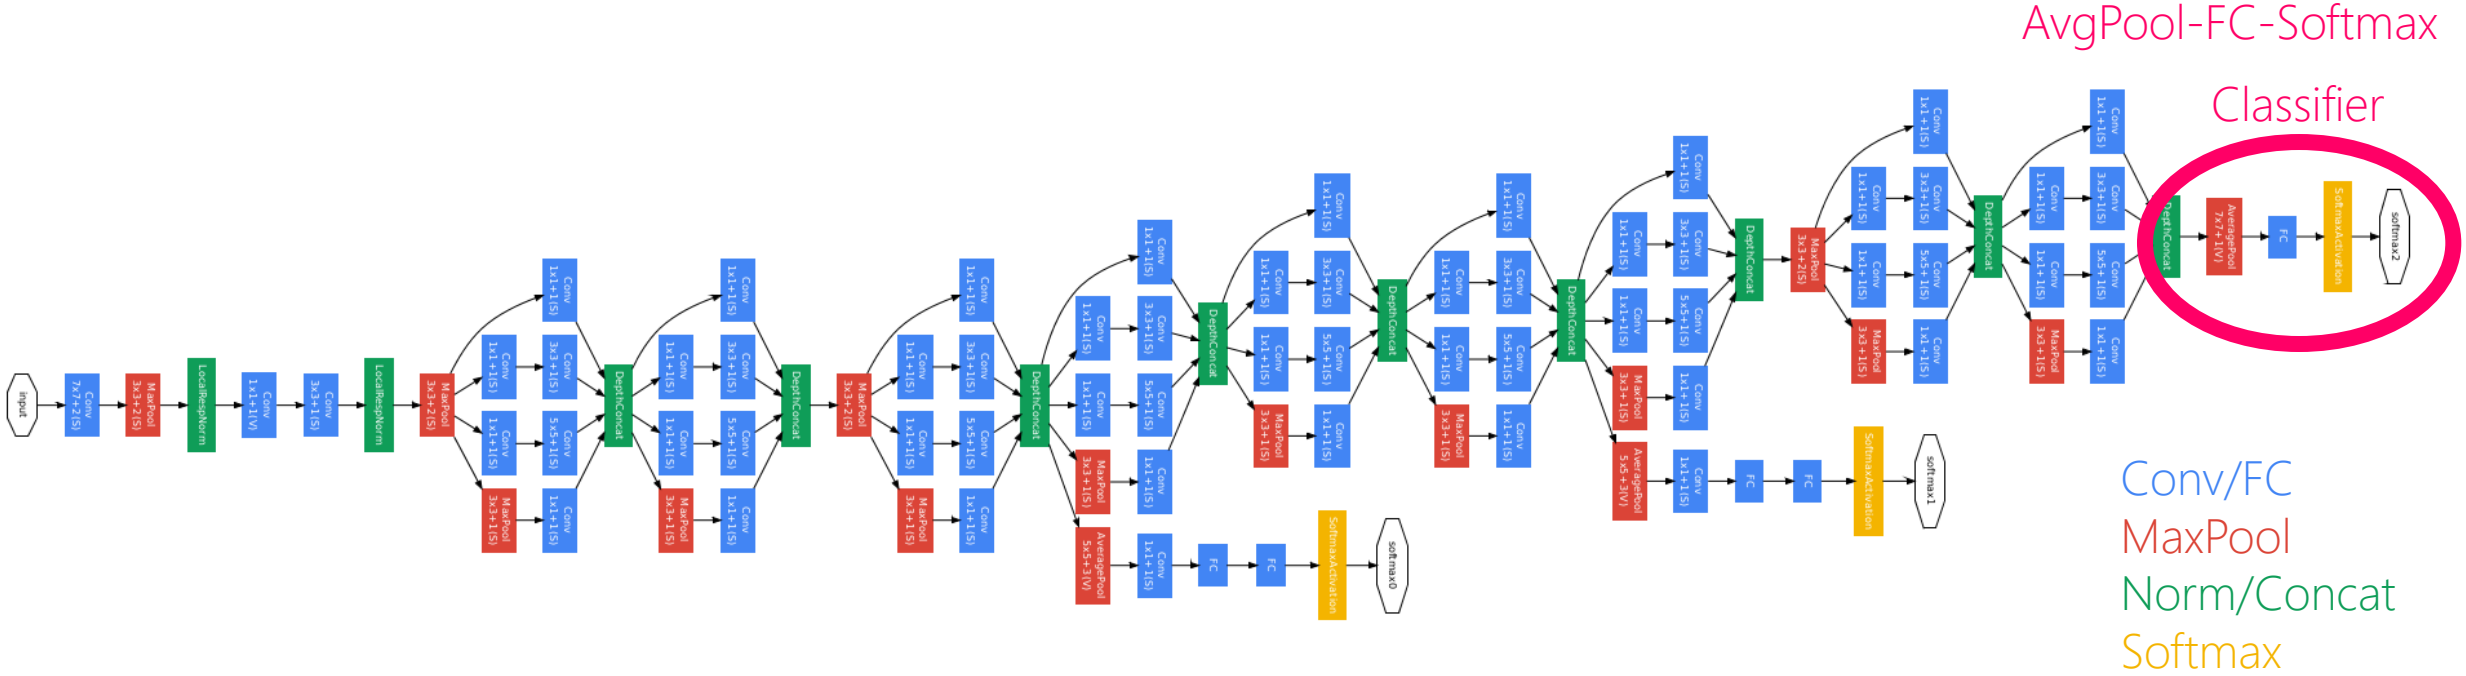
GoogLeNet a.k.a. Inception Network

- Putting them all together…



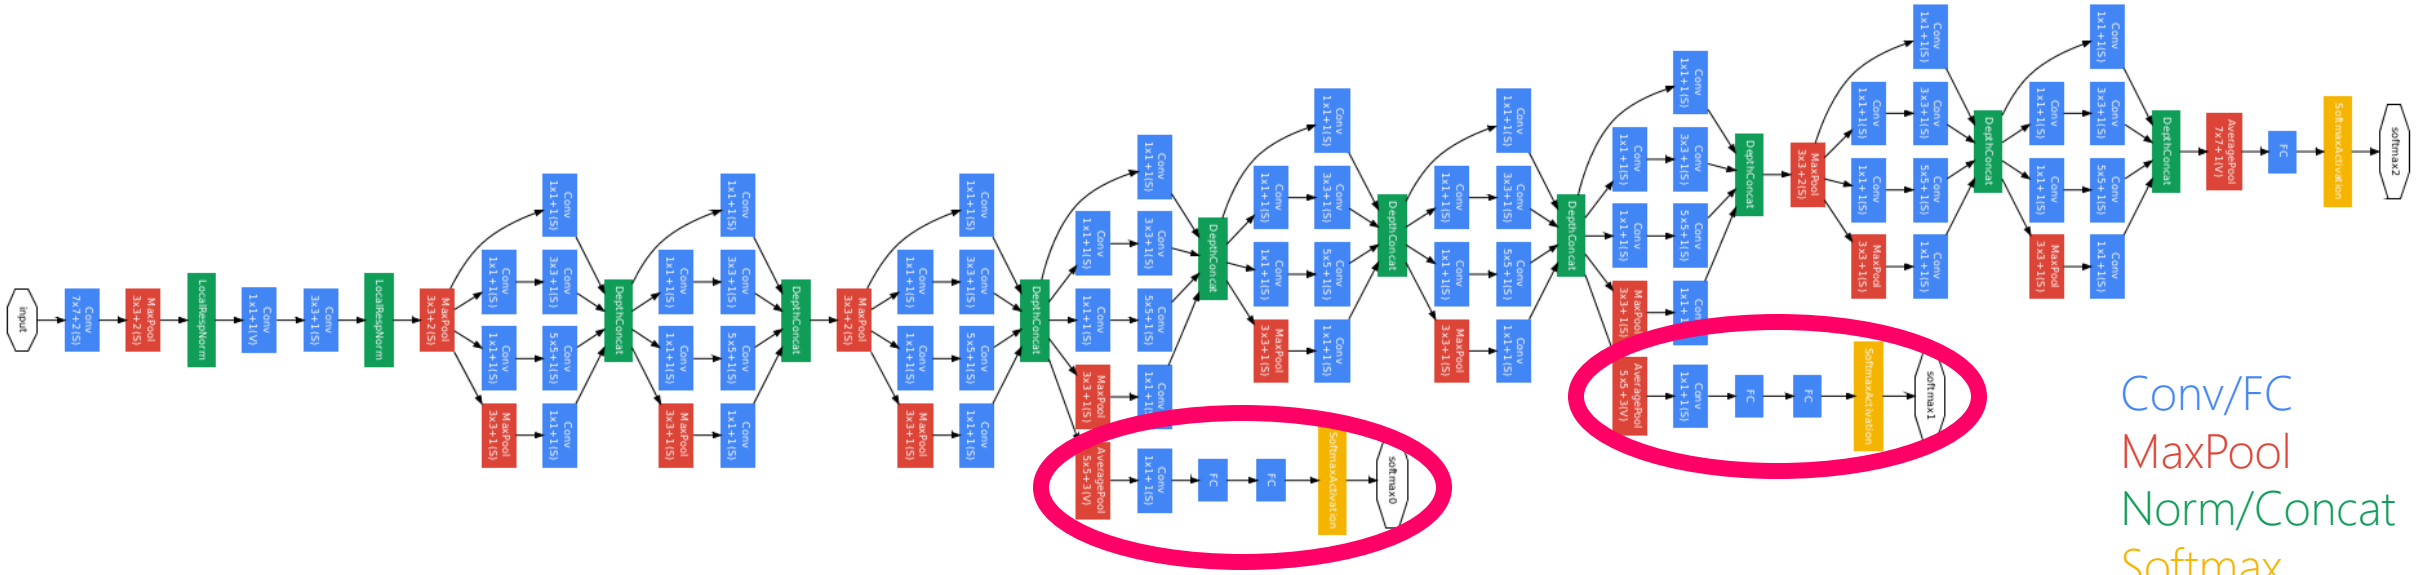
GoogLeNet a.k.a. Inception Network

- Putting them all together…



GoogLeNet a.k.a. Inception Network

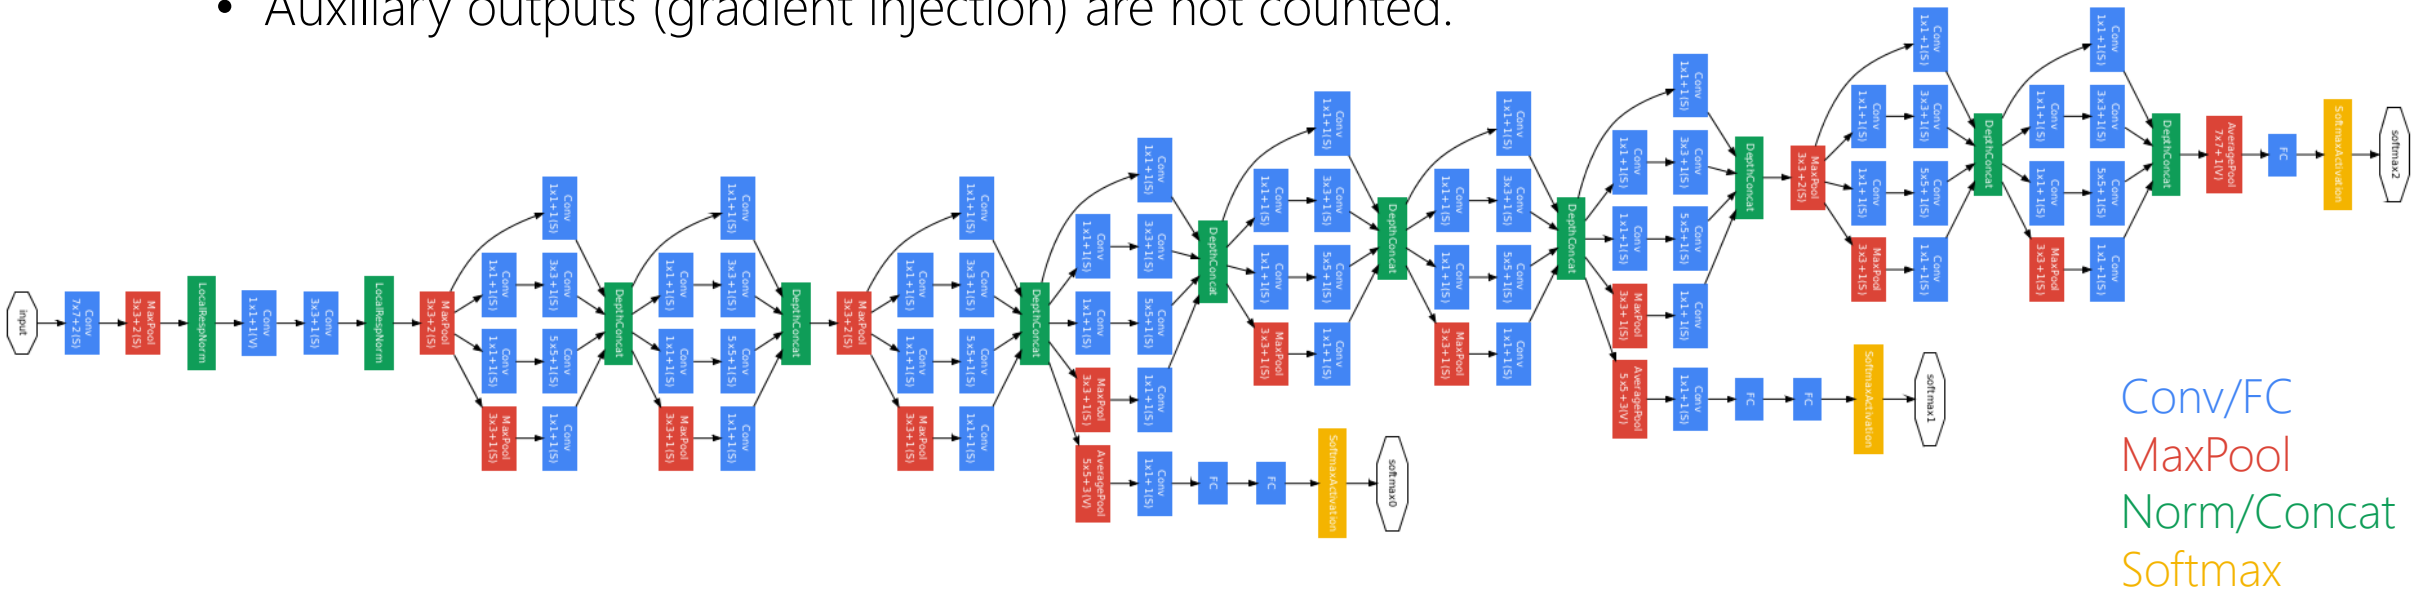
- Putting them all together…



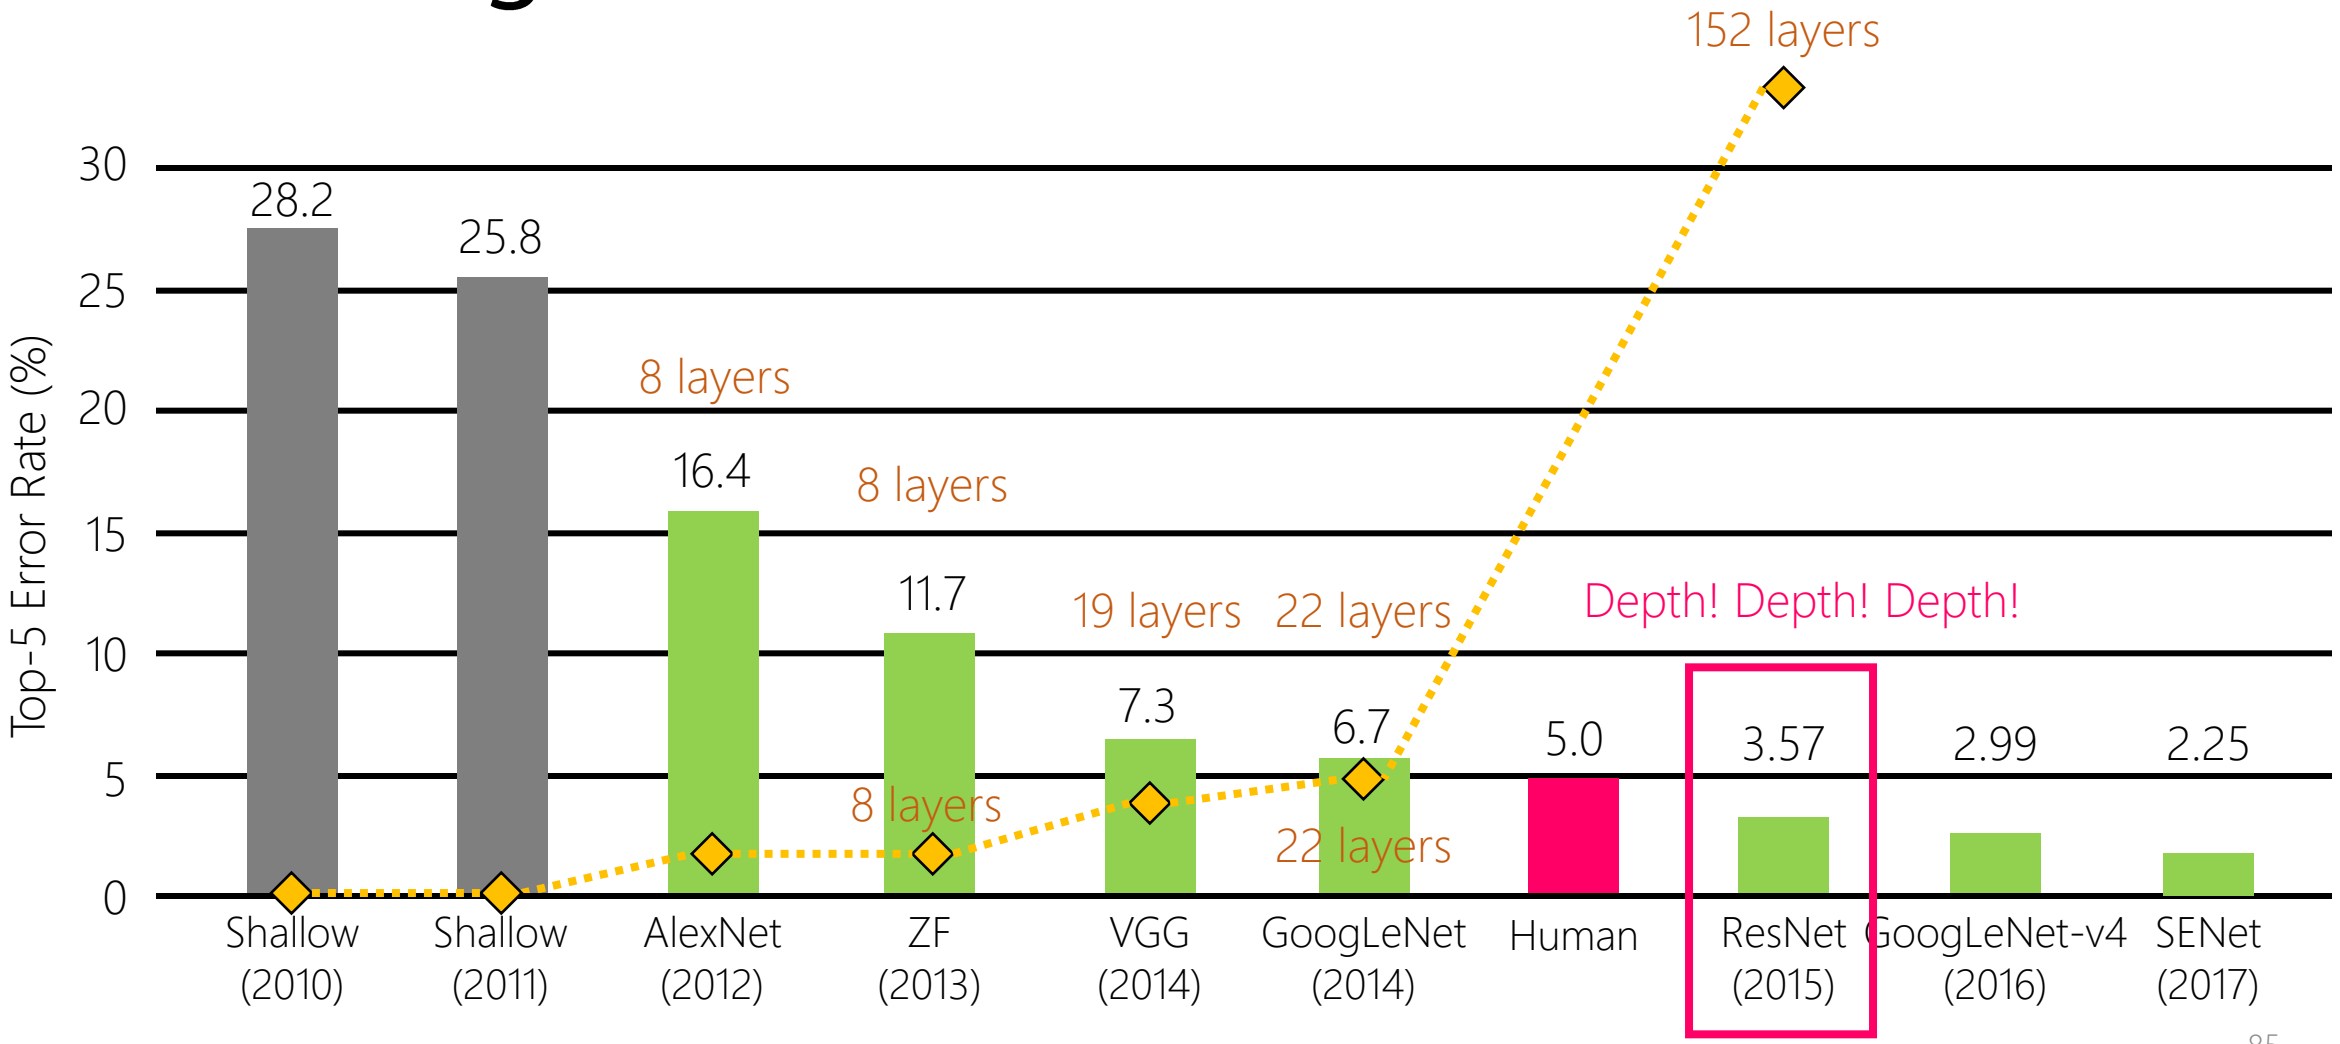
Additional classification losses to inject additional gradients in order to prevent vanishing gradient.

GoogLeNet a.k.a. Inception Network

- How to count 22 layers?
  - Parallel layers are considered as one. (i.e. 2 layers per inception)
  - Auxiliary outputs (gradient injection) are not counted.

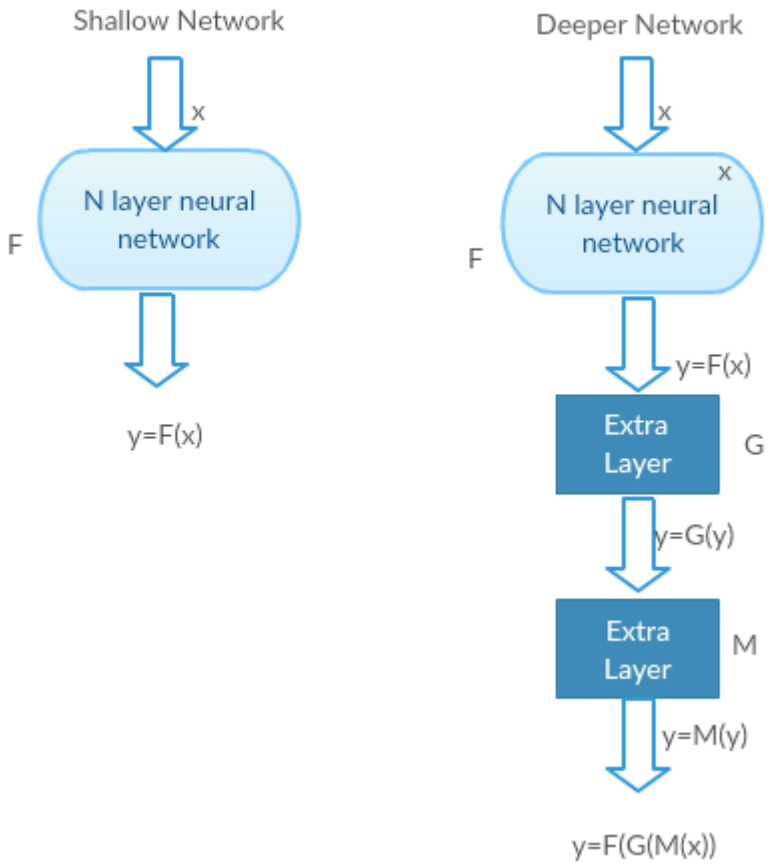


ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners



Adding more layers seems to work well, but…

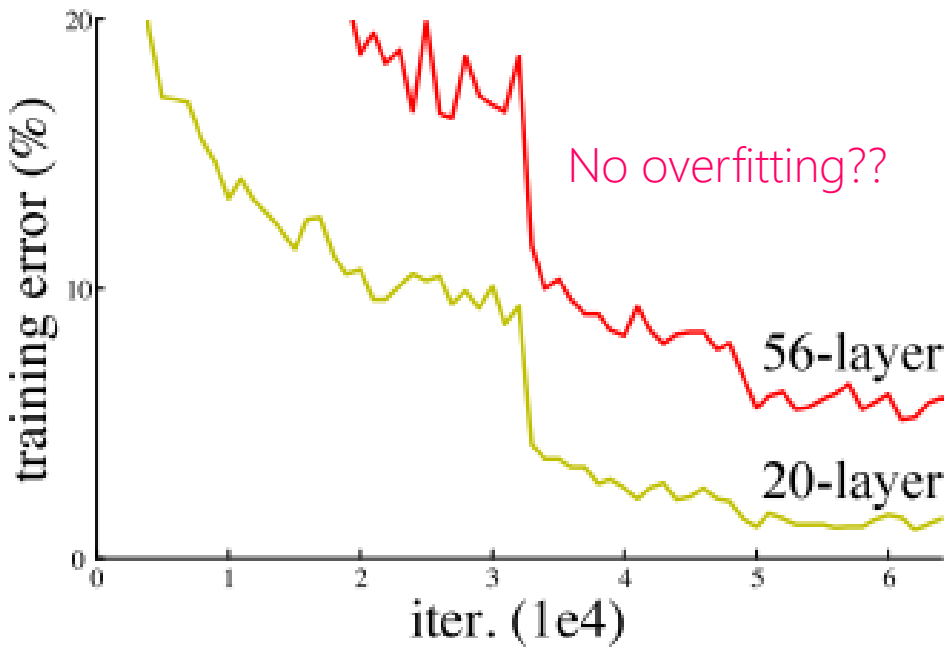
- Deeper models should be able to perform at least as good as shallow models…
- Why?

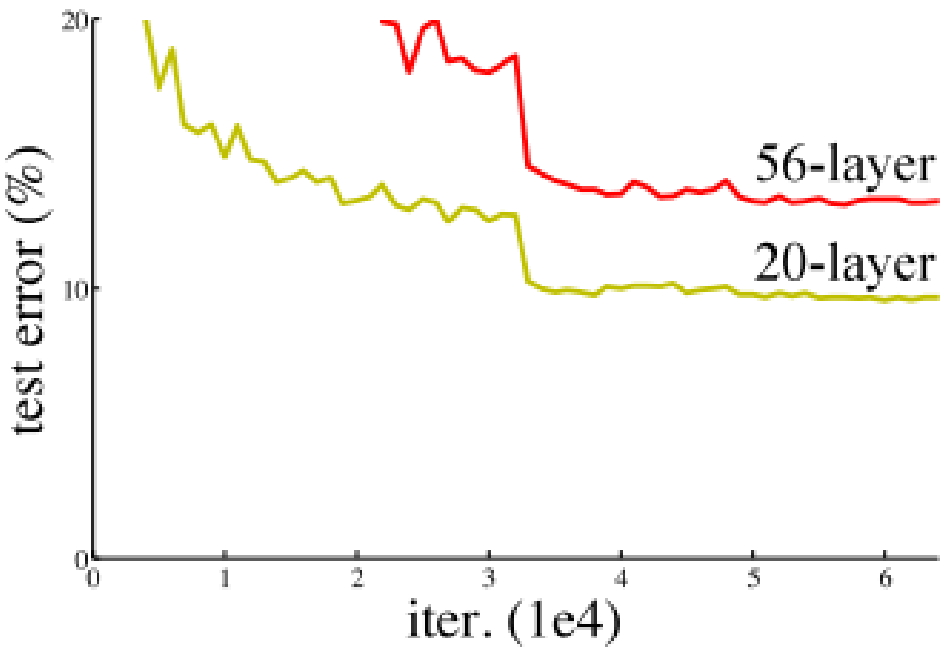


https://medium.com/@14prakash/understanding-and-implementing-architectures-of-resnet-and-resnext-for-state-of-the-art-image-cf51669e1624

Adding more layers seems to work well, but…

- Degradation of accuracy with more layers…

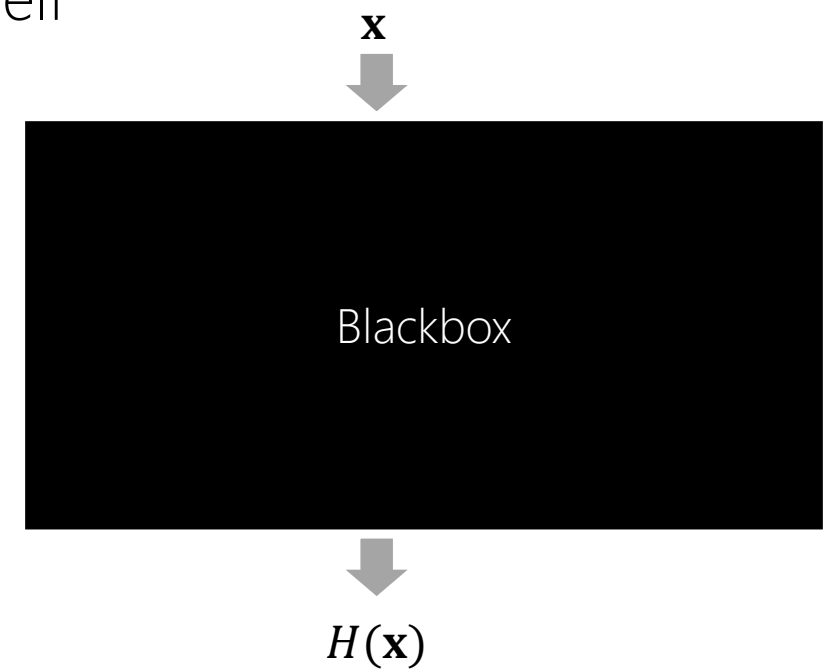




https://towardsdatascience.com/an-overview-of-resnet-and-its-variants-5281e2f56035

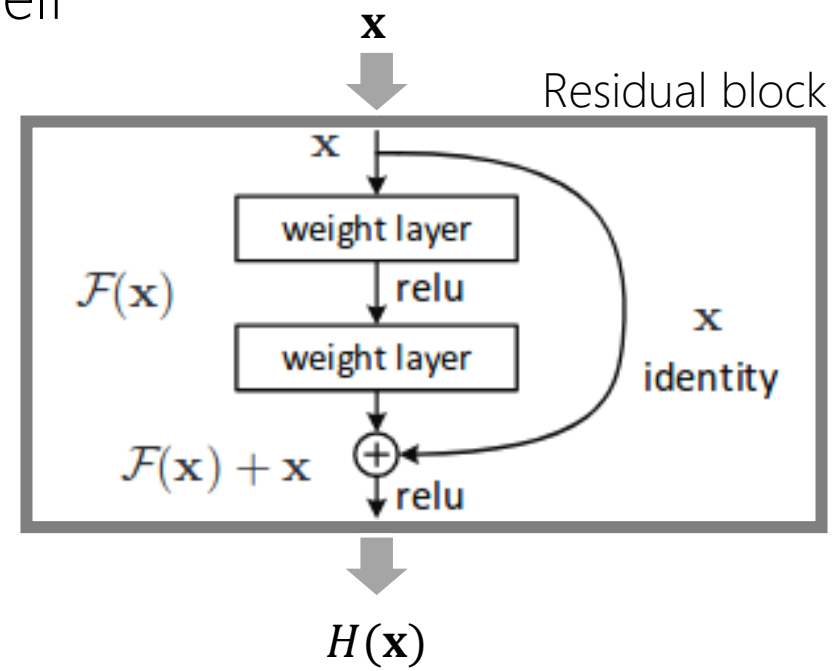
ResNet

- Hypothesis: the degradation problem is due to an optimization problem (deeper models are harder to optimize)
- Proposed solution: Let's fit the residual (i.e. the extra accuracy gain of a conv block compared to the identity mapping) instead of directly fitting the underlying mapping itself



ResNet

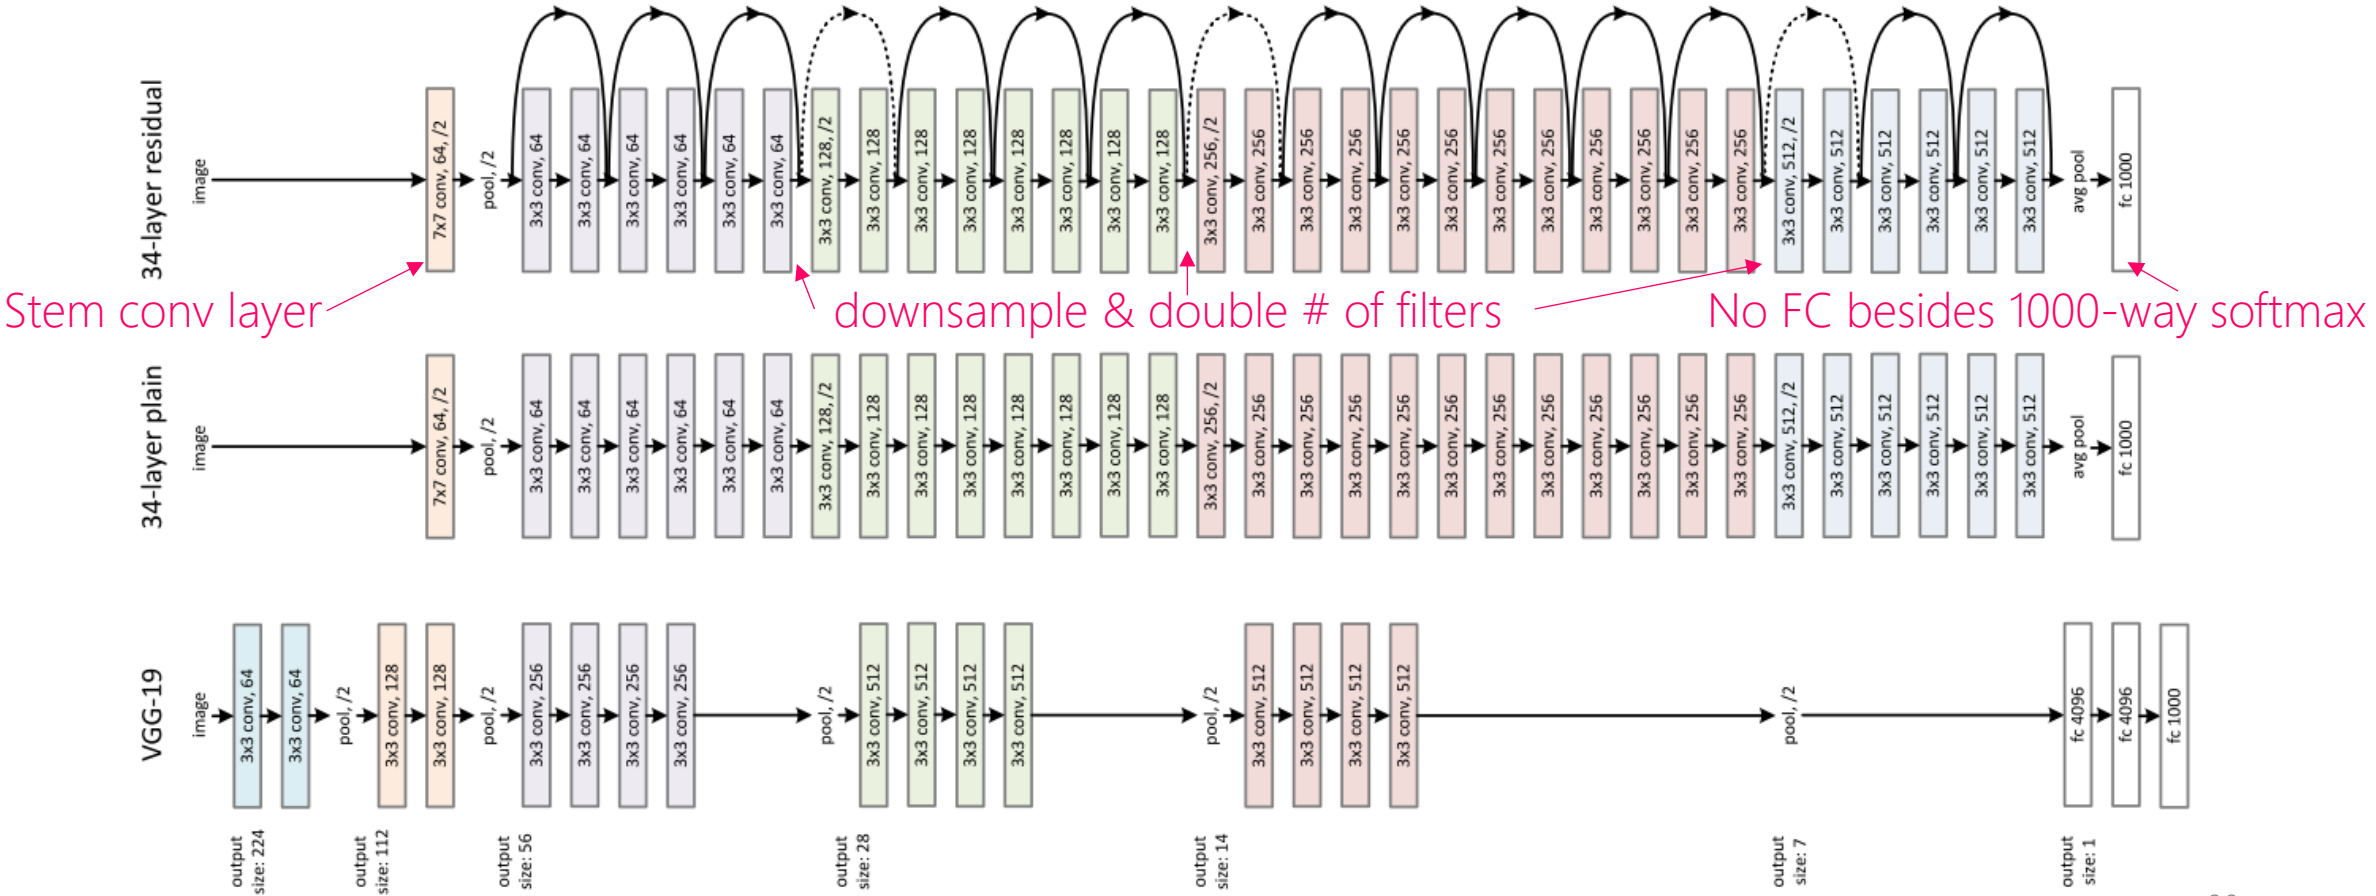
- Hypothesis: the degradation problem is due to an optimization problem (deeper models are harder to optimize)
- Proposed solution: Let's fit the residual (i.e. the extra accuracy gain of a conv block compared to the identity mapping) instead of directly fitting the underlying mapping itself



Fit F(x)=H(x)-x (residual) instead of H(x) directly!

ResNet

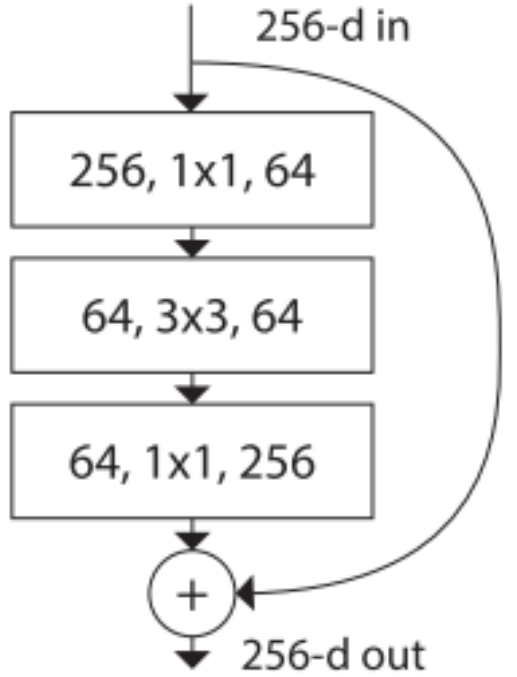
- Full ResNet architecture: stack residual blocks each of which has two Conv3.



https://towardsdatascience.com/an-overview-of-resnet-and-its-variants-5281e2f56035

ResNet

- ResNet-34, ResNet-50, ResNet-101, ResNet-152 available…
- ResNet-50+ uses bottleneck layers to improve efficiency



- Batch normalization after every conv
- SGD with Momentum 0.9
- Learning rate: 0.1, divided by 10 when val error plateaus
- Mini-batch size 256
- No dropout

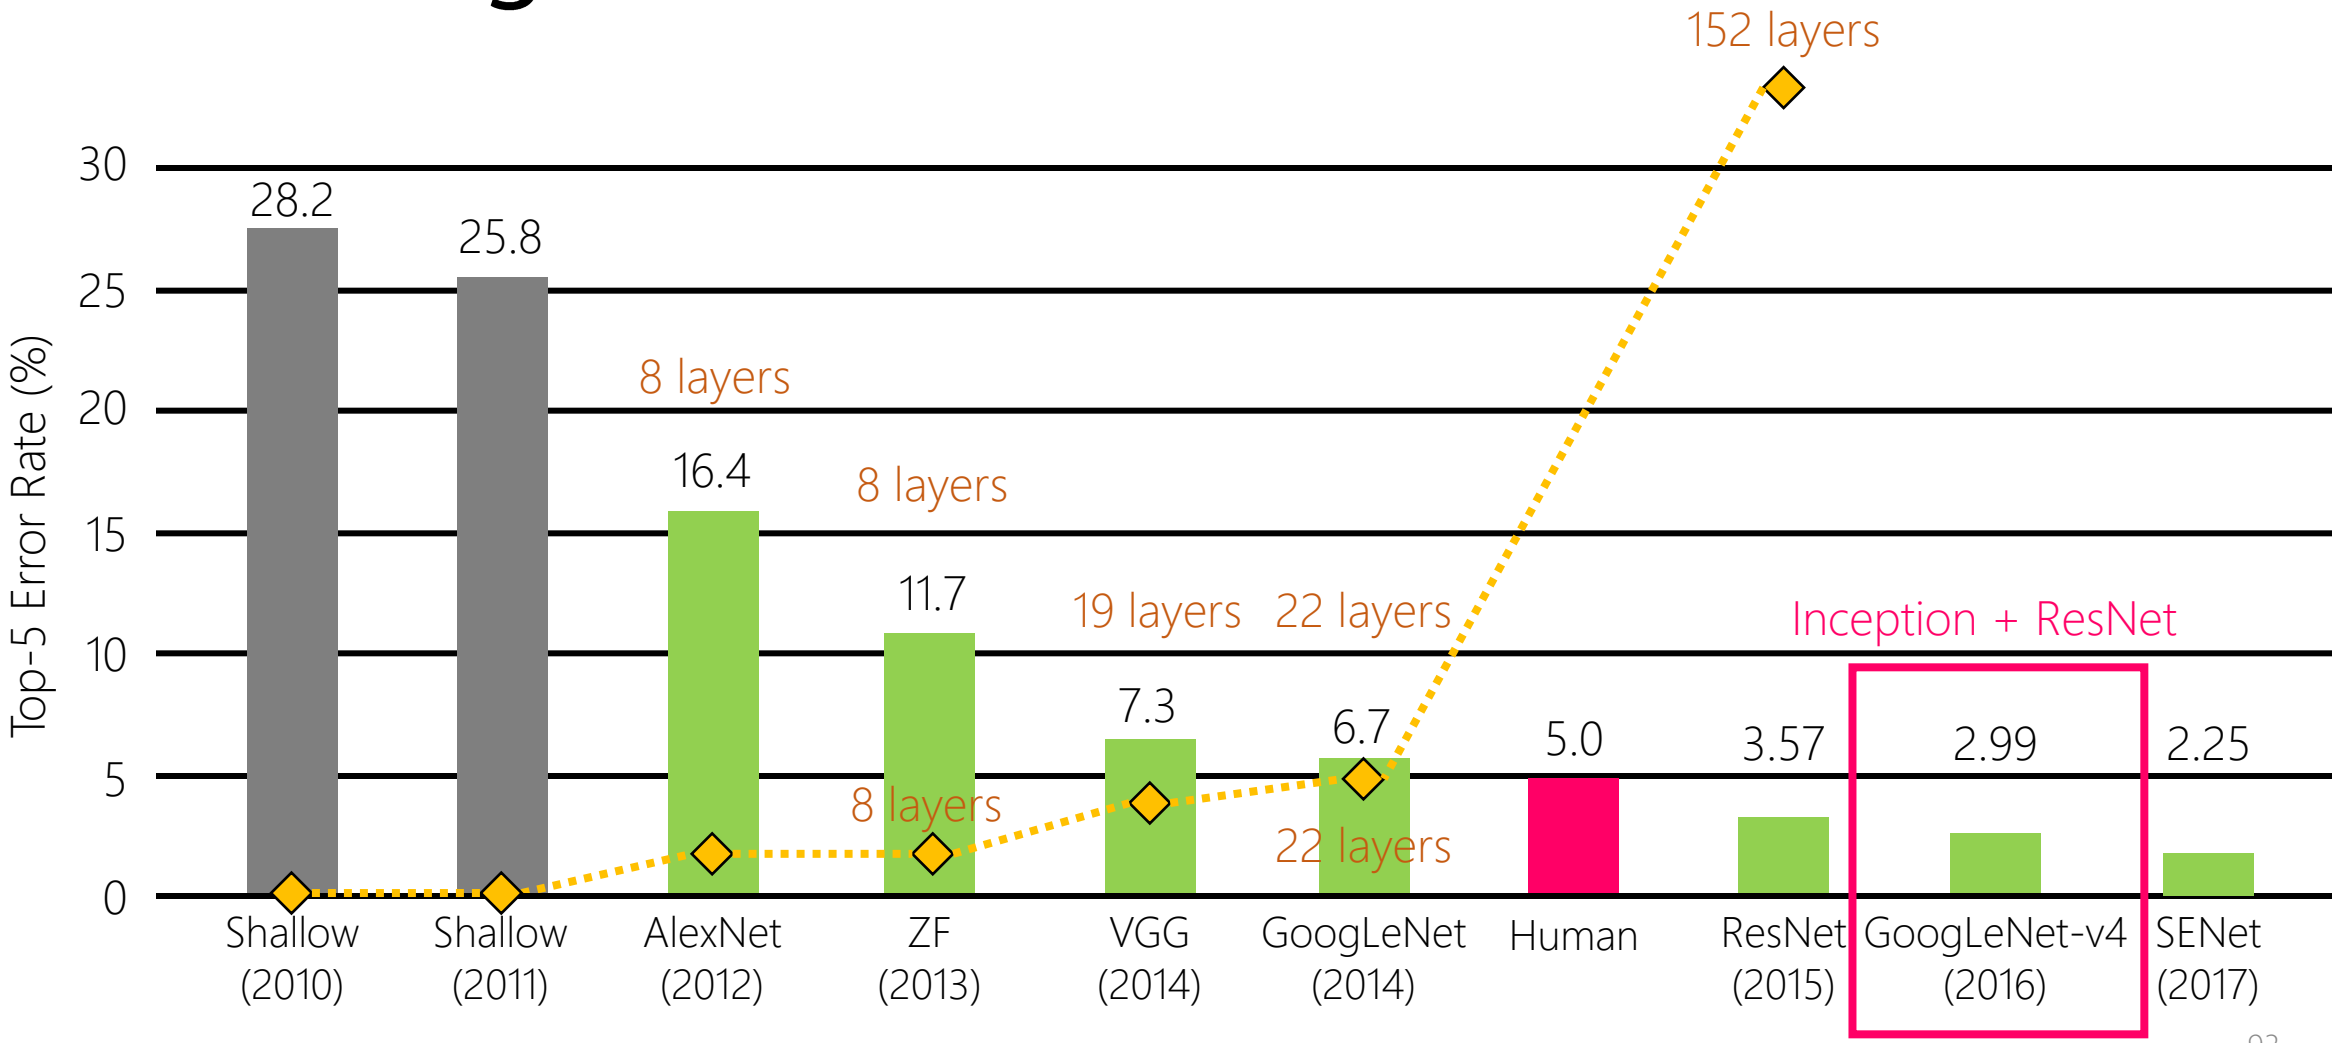
→ Can be trained without degradation

ResNet

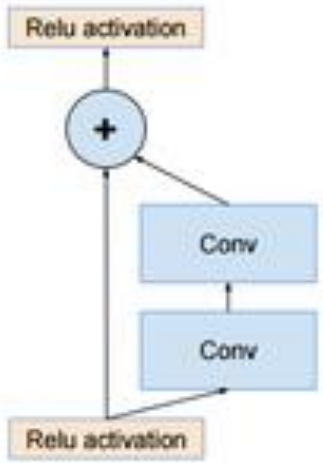
- Swept 1st place in all ILSVRC and COCO 2015 Competitions

- Better than human performance now!

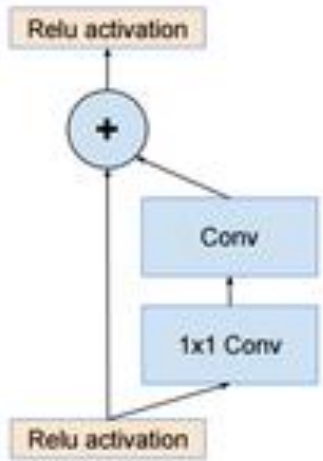
ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners



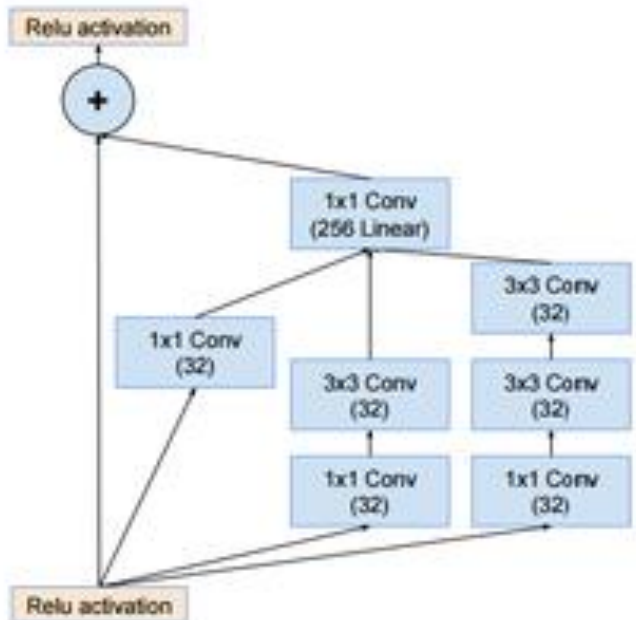
Inception v4 (a.k.a. Inception-ResNet)



(a) Residual module introduced by He et al. (2015)

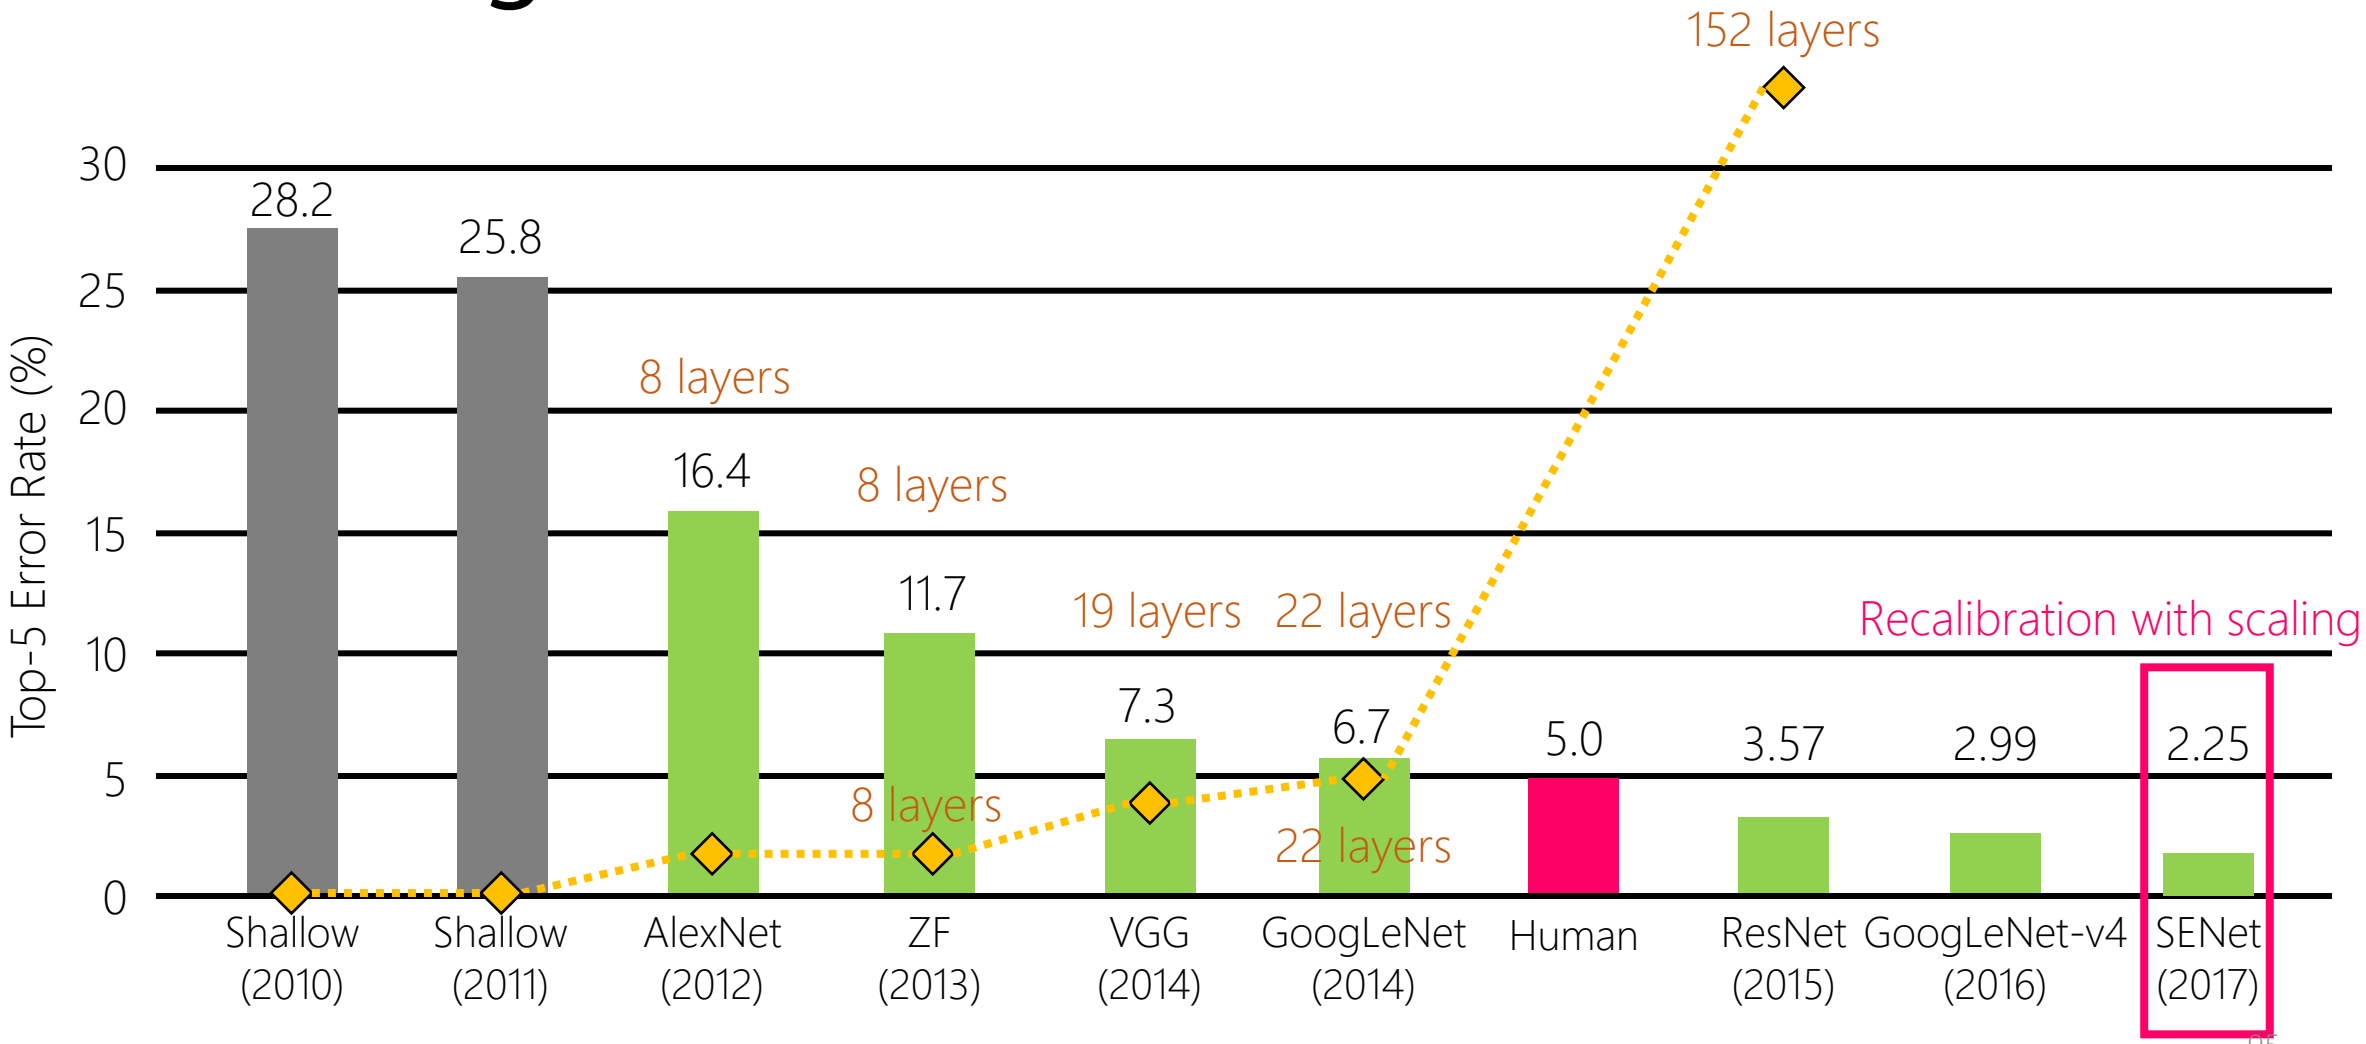


(b) Optimized version of residual modules to shield computation, like in Lin et al. (2013).



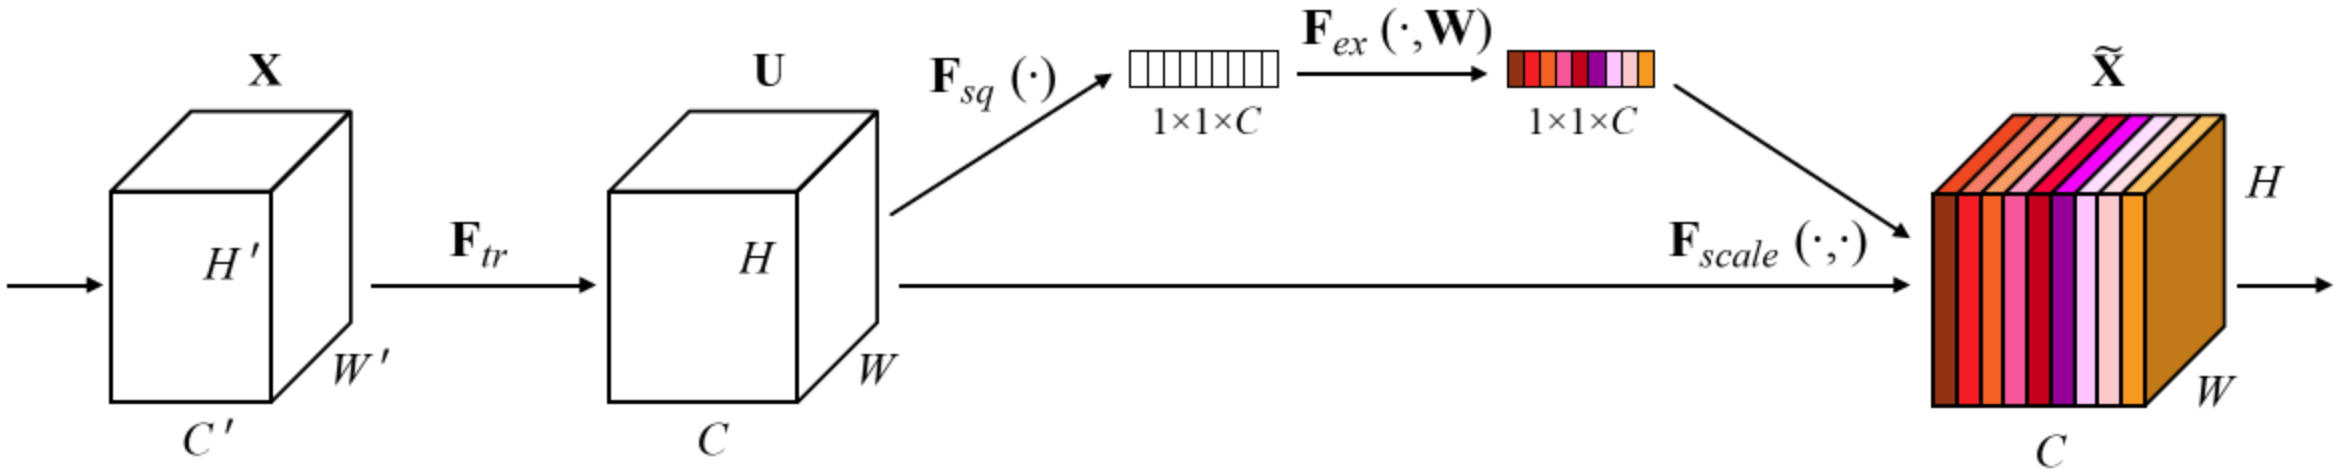
(c) Inception-ResNet example module for the 35×35 grid.

ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners



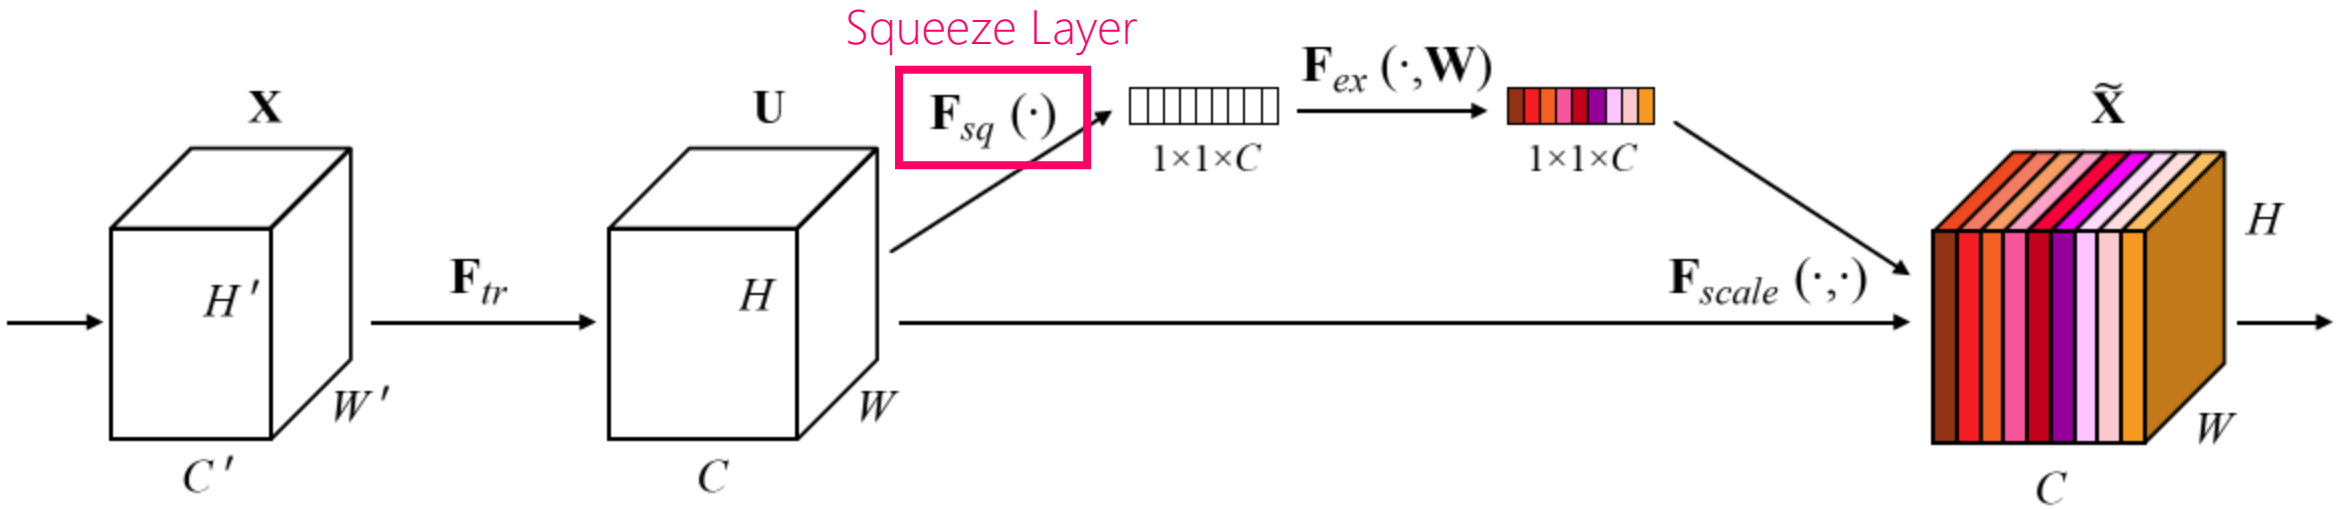
Squeeze and Excitation (SE) Network

- Recalibration of the activation maps with the global average



Squeeze and Excitation (SE) Network

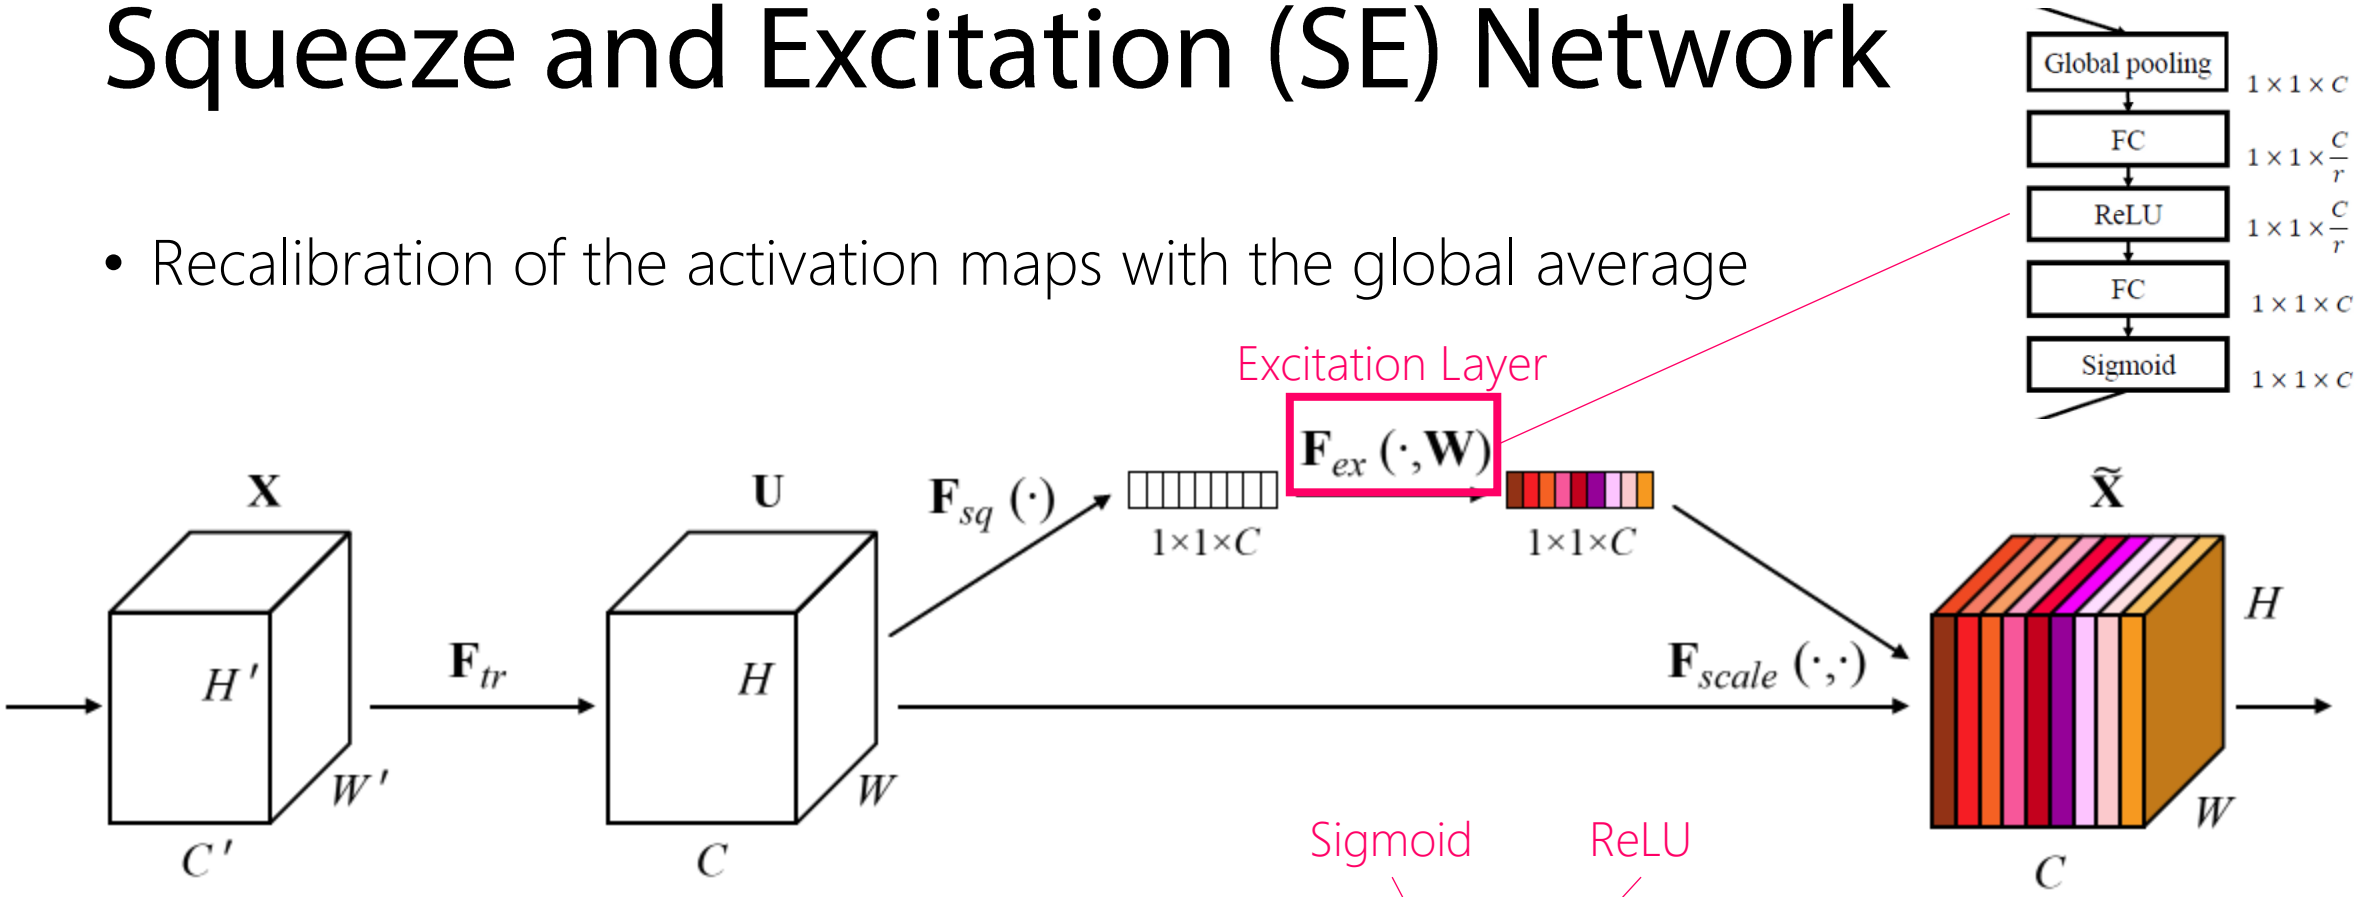
- Recalibration of the activation maps with the global average



$$z_c = \mathbf{F}_{sq}(\mathbf{u}_c) = \frac{1}{H \times W} \sum_{i=1}^{H} \sum_{j=1}^{W} u_c(i,j).$$

Squeeze and Excitation (SE) Network

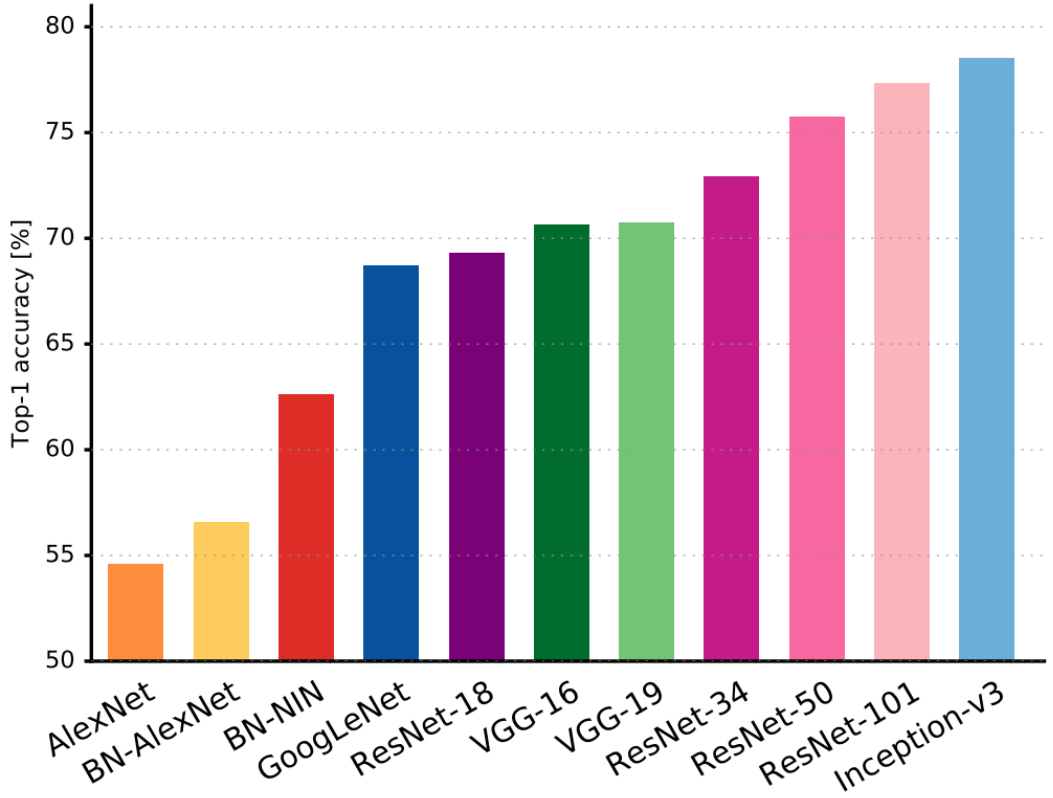
- Recalibration of the activation maps with the global average



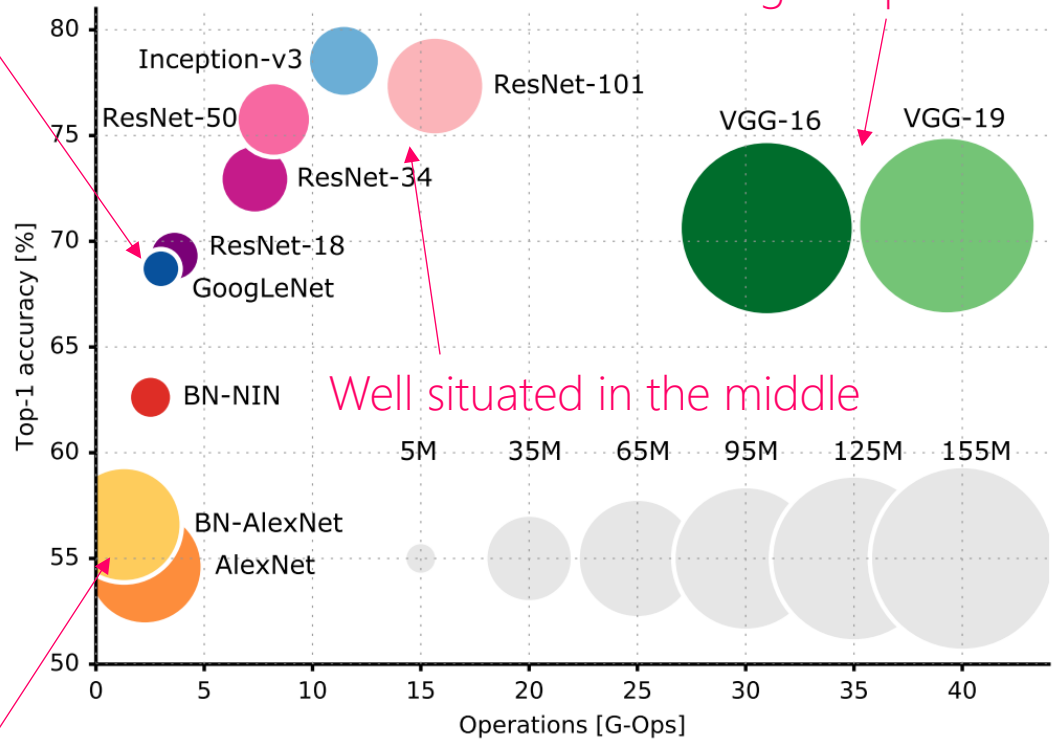
$$\mathbf{s} = \mathbf{F}_{ex}(\mathbf{z}, \mathbf{W}) = \sigma(g(\mathbf{z}, \mathbf{W})) = \sigma(\mathbf{W}_2 \delta(\mathbf{W}_1 \mathbf{z})),$$

r: Dimensionality reduction ratio (4, 8, 16, 32)
Captures channel-wise dependencies
Learns a nonlinear and non-mutually-exclusive relationship between channels.

Alex, VGG, ResNet, Inception at a glance



Most efficient



Largest memory,
Largest operations

Well situated in the middle

Smaller computation, but memory heavy
Lower accuracy
